Sounds like an environment path problem to me, I'd suggest adding the line:

#_ENV EVEREST=D:\EVEREST\ (modified to suit the exact path of course) to the
Magic.inf file. That works for me.

Speak to 'ya later!

It does. I very much doubt that it would be possible for at least three companies to sell MetaDOS based CD ROM drivers in Germany if it wouldn't.

> S> I wonder
> S> if the fabled Magcic XFS would help him.

There are at least two, one of which is SPIN!.

MetaDOS isn't a CD-ROM driver. MetaDOS is a GEMDOS extension which allows to load XBIOS (device) and filesystem drivers. It just happens to come with a device driver for CD-ROMs and a filesystem driver for ISO9660.

And please define "not very compatible to anything"?

>Also what is SPIN?

SPIN! is a collection of CD-ROM related drivers. It currently contains a BOS driver for MetaDOS, based on CBHD and HDDRIVER, a MiNT filesystem and a MagiC filesystem. See http://www.muenster.de/~reschke/soft_e.html#spin.

> JR> As the number of LUNs is limited to 8, there shouldn't be a

>I'm sure that he would be interested in any information you could give him on
>achieving this with his Panasonic DRM-601.

Well. Install the latest MetaDOS release. Install a BOS driver which supports LUNs above 0. Install a recent DOS driver. Use up to 32 drive letters (sorry: 32-26=6, not 10, I admit).

There's an easy hardware way - ScreenBlaster. It's a cable you plug
in to various ports, and it gives you greatly improved video modes.
Not too sure about TrueColour - although a Nemesis board (relatively
fiddly!) fixes that, and also speeds it up.

The kind of processor power required for the real-time compression of audio to the kind of bandwidth available on the Internet is way beyond any Atari - even a 100MHz Pentium would have problems.

Anyway, short-wave radios often give better, more reliable (and cheaper!) sound from remote radio stations - at night, I can pick up Moscow, the US and India from the UK using a standard radio with a tiny aerial.

Source record: 118476

Magnus Kollberg wrote:
>
> Well it does still look much better than in CAB and it
> doesn't have to change the palette either like CAB does.

Well, the first point is that 1stGuide and Netscape use
Floyd-Steinberg dithering as default. This provides
superior results and is reasonably fast with the efficient
implementation in the public JPEG library (file 'jquant1.c').
You can also find an adapted implementation in my portable
fixpix code (http://www.esc.de/homes/guivol/fixpix/).

Another point is that it's *not* quite straightforward
to avoid palette changes when using the uniform 8 colors
from the 16 color default palette! This requires a little
'trick'. 1stGuide seems to be the only Atari program which
cares about this. With all other (graphics) programs I had
always trouble with image display in 16 colors.
Unfortunately, other authors don't seem to care about this
issue, because they only had to ask me how it could be done.
This is again typical: Atari authors want to build
everything from scratch by their own, without taking the
chance to exchange experiences with other developers.
I tried to publish many of my source codes, but to no
avail. There was no interest in the Atari domain.
The platform-independent community (Unix/X), on the other
hand, appreciates any useful contributions.

Yet another point is the color handling in 256 color modes.
Here, 1stGuide also must change the palette. I've only cared
that the default (desktop) colors are not affected.
It's always difficult to find a reasonable color management
in paletted color modes, you must choose some compromises,
on *all* systems.
My suggestion for Ataris was that authors of general-purpose
graphics programs commit to a commen suitable palette in 256
colors, that is, the known uniform 216 color palette (thus
avoiding any unnecessary palette changes). Then, the only
other point to determine would be to fix the mapping of
the color values to color indices.
However, from the above point it is clear to derive that
such an approach is an illusion here, unfortunately.

Regards,
Guido

OK, Nick!

I tested this .prg, both versions 2.4 & 2.5, but nothing from this
doesn't wonted to work on my Mega4/STe with TOS 2.05 (?!).
I plugged in 8 or may be (don't remember!) 10 (!) mauses from deference
manufacturers to all serial ports (from Modem1 to Serial2), but no one
maus doesn't worked out too.

If your experiments will be more successfully, please, report me about.

At last time, and why coul'd you been to try to reconstructing standard
PC-maus?

Good hunting on mauses!

Has anyone out there got a graphics card fitted to their Falcon? If so, would it be possible to send some
gembench results, stating what make it is and any other hardware mods fitted please.

I'd like to squeeze more speed out of mine, and the biggest bttleneck seems to me to be the graphics memory being drawn from ST ram. I'd like to imagine that the Falcon is capable of the
speed obtainable in mono, but in 24 bit colour :-)

Some body please put me out of my misery and either confirm or deny this.

I took myself off ages ago with no problems. With any luck you can get
NOS/Oasis working soon, NOS can be set up to reject mail (if your
provider offers SMTP mail delivery) so you can bounce the crap straight
back at them which should hopefully make them stop pretty quickly or at
least you won't have to read or download it :-)

Maybe the problem is at your end and not the sites or the whole
internet :)

> the failed attempts netwise it might have proved cheaper and
> quicker by snail mail (!!!!!)

ooer no smilies? Just one would have made all the difference :(

You have to consider the stuff you have downloaded as well, offset
against the failed attempts, everyone gets failed downloads you know,
I went to the extra expense of uploading to my web page, and the
possibility of chastisement from my isp for going over the limit as
mentioned, this for no advantage to me,purely to try and help you out
because you are having trouble with the geocities site, but hey, I did
it because I wanted to, how many people downloaded it succesfully, ???
but all I get is messages in public tha......ho sod it..I dont do it
for thanks,

Taking this into consideration then the only people allowed to moan
about failed downloads in a public newsgroup for everyone to read are
the people who also mention all the good stuff they have got to the
same audience, we wouldnt want people to think its not worth
downloading STOSSER diskzine or ST+ diskzine would we?, both sides of
the story hey ? :)

Yo ynot!

The Geocities file is corrupted as it will not unzip. The site says it's 778k, but the file is ~728k? Anyway, I had no problem getting ST+19 from your Web Page and it works OK. I must say running the file on my Falcon was an experience. What is it with you guys :) I got dizzy just playing with the floating box using the mouse! I quess you'all are just wild an crazy guys!!!

One thing that does play games with me is NVDI. The built in Font, (Monaco?) causes the text to be too large and corrupts everything so I have to disable it. This has always been the case for me. If there is a way to get it to work with NVDI let me know. Great job to all... (Yes, I use ST low rez)

Regards,

Charles

Isn't this becuase of legal difficulties with Pure C? They can't
update it as it's part of Borlans copyright, or something like it.

> people don't seem to care about such odd developments. In fact,
> it's no wonder why the Atari is rapidly falling behind other
> systems in development with such behaviour.

Well, there is GCC which is still being upgraded for the Atari. Lattice
C and Pure C is still very capable even if they havn't been updated for
a long time. Lattice C is also completely ANSI C ompatible.

> > So it wouldn't be totaly impossible to adapt this library to Pascal

Yes that would be nice, but I know of people who doesn't access
the news anymore because they think it's not what it used to be
and full of bull shit talk.

Unfortunaly.

I think this is what CAB needs if we want to be able to run it
in 16 colour modes and doesn't have to stand this poor display
with pictures as it has now. Background pictures are totaly
out of the question in 16 colour mode. I think most people use
greyscale mode as well becuase of this.

> Another point is that it's *not* quite straightforward
> to avoid palette changes when using the uniform 8 colors

Yup I know.

> Unfortunately, other authors don't seem to care about this
> issue, because they only had to ask me how it could be done.

I hope some will. Why not make some of this info available on
your webpage? It could be a good programming resource for
people to get good ideas and help with problems. Maybe put
some sources would be a start.

> This is again typical: Atari authors want to build
> everything from scratch by their own, without taking the
> chance to exchange experiences with other developers.

This is realy stupied. I usually do it the other way around.
I use to look at other guys code and get ideas and borrow
a bit here and there. I call it "lego" programming. :-)
Ofcourse you can't just do it like this, but lookin on old
sources does often help you alot, if they are easy to follow..

> I tried to publish many of my source codes, but to no
> avail. There was no interest in the Atari domain.

Sad to hear. :-(

> The platform-independent community (Unix/X), on the other
> hand, appreciates any useful contributions.

Yes I guess that is the main reason people like Linux so much.
I can't see why we can't get the same on the Atari.

> However, from the above point it is clear to derive that
> such an approach is an illusion here, unfortunately.

:-(

We are all DOOMED! ;-)

Source record: 118414

Hi Adam,
I've thought about screenblaster but I think I have a hardware conflict.
As I understand it screenblaster needs to plug in to the joystick ports
of the falcon. Those ports are currently covered up by my c-lab combiner
(a dongle expander). Since I use the falcon mostly for music, having
multple music programs available (cubase & zero-x) is of vital
importance. So unless I'm wrong about the hookup (and it wouldn't be the
first time), this option won't work for me.

ok well hopefully pete is readiing this.. you see I now have nothing
to do with uploading st+ or with running the st+ site, i set the
system up for them then handed the whole caboodle over, however having
a vested interest anyway :), I uploaded it to my site to try and
help.. Pete will get your message and hopefully replace the file on
the actual st+ web page,

>your Web Page and it works OK. I must say running the file on my Falcon

So the one from my page ok.. well thats great thanks :)

>was an experience. What is it with you guys :) I got dizzy just playing
>with the floating box using the mouse! I quess you'all are just wild an
>crazy guys!!!

If you turn any accelerators off then it should run the same speed as
on a st, because i halve the native 16mhz, i cant set the speed, only
halve it, although moving the mouse/box around is still fun:)
>
>One thing that does play games with me is NVDI. The built in Font, (Monaco?)
>causes the text to be too large and corrupts everything so I have to disable
>it. This has always been the case for me. If there is a way to get it to
>work with NVDI let me know. Great job to all... (Yes, I use ST low rez)

ok we know about this, i dont have nvdi so havent seen this, but yes
i am told it messes up , it wont do the screen saver any good either,
(have you seen the spotlight screen saver in the main menu hehehe)

Right, obviously a peice of software that asks you to turn
accelerators off and to disable nvdi is not brilliant :(, but as this
is a diskmagazine and we presume your going to sit down to a good
read, taking more than a few minutes, then booting clean is worth the
experience:)

BTW..an undocumented silly bit :), in the main menu when you have NOT
selected a catagory ie: the box can move... try pressing F1 F2 or F3
:)

To: morphic@speakeasy.org
Subject: Atari repair

Hello _-ARIK-_,

Wow! Another Atari user in Seattle! Always nice to find another one. I got my first Atari in '86(?). An ST. Now I have a Falcon. Mainly music, also dtp, word processing, internet, and games. For Atari repair in this area I used to go to Bud Berg (in Redmond area). 814-2473. However, he had a heart attack earlier this year and I'm not sure how he's doing now. He had recently retired from running (owning) Xanth Computers. Right before I sold my ST, the power supply went bad, and Bud put a new one in for me for a very low price. He may still have a few more left over from the store. It wouldn't hurt to give him a try. Power supplies are very simple to trade out, and you can do it yourself if you don't mind taking your ST apart. But... DON'T TOUCH ANYTHING IN THE POWER SUPPLY UNTIL IT'S BEEN OFF LONG ENOUGH FOR THE CAPACITORS TO COMPLETELY DISCHARGE, or you can get a nasty SHOCK! Maybe 5-10 minutes, according to Bud. As far as I know, there are no longer any Atari related computer stores left in the Seattle area. A good place to send it to would be ATY computers in California. (510) 482-3775. Alex is the owner and is very helpful. For other Atari parts, software, etc, try Chris at Computer Direct in Edmonton, Alberta, Canada. (403) 496-2489. They're on the web at http://www.compdirect.com (or something like that). I recently purchased the NEMESIS upgrade for my Falcon (from Compdirect) and plan on sending down to Alex for him to install. It's a pretty complicated task.... beyond my meager soldering abilities.

I hope this is helpful. Let me know how you do, and if you have any other questions. If you talk to Bud, tell him you got his number from

me.

>few inches onto a hard surface. This can reseat those loose chips.

I used to do the drop fix on my 520 quite a bit but my Mega STE4 is solid as a rock. If the drop fix doesn't work, take the box apart and locate all the socketed chips. Then gently push down till you hear clicking/seating sound on all the chips.
The cold joint theory is also an option but generally they only happen in power supplys (lots of heat).

My disk drives are beginning to go out on my old ataris. I read somewhere that this was typical for older machines because of the solder where something interfaced with the board loosened. Yeah, I've done the 6" drop- it worked for a while, but I really need to fix 'em, not drop 'em!

So, gurus, please tell me how it's done!

Thanks in advance!

Mike McGowan

1852. WRAG Next Meeting

Newsgroup: comp.sys.atari.st
Date: 1997-08-13 00:00:00 UTC
From: please@no.spam.mail.here.nest
Message-ID: <183_please@no.spam.mail.here.nest>
Source record: 118428

Hi All fellow WRAGgers,

Here are the details of the change ofvenue for the next WRAG meeting, Sunday 31st of Aug. It will be held at: 1 Vale Street, Brighouse.

How to get there:-

By bus from Bradford: get the No 363 bus, running from stand B4, at 15 and 45 mins past the hour, in the Interchange - ask for Brighouse police station and ask for the driver to tell you when you are there (it is approx 25 to 30 mins from Bradford). It is the stop after the MARTINS NEST pub!! (on your right).

Cross over the road, and head up Gathorne Street, immediately after the bus stop to Bradford. Get to top of this street, reaching a crossroads: road running left to right is Old Lane: directly opposite is Vale Street -- our house is the first one on the left hand side -- knock on the bottom door...

By car: get onto the Manchester road, heading towards to Huddersfield. Stay on the main road, following the signs for Huddersfield/Brighouse, past Wyke, through Bailiff Bridge (roadworks), and follow the road until you pass the MARTINS NEST pub on your right, and turn right immediately before the pedestrian-controlled crossing, drive up this road (OLD LANE) for 50 feet or so, and turn left by the BISMILLAH curry house (you are still on OLD LANE !!!). Third street on the right is VALE STREET. Park where you can!!! Our house is the first one on the left-hand side, knock on the bottom door...

All welcome, from 1 pm onwards until 6 pm (ish), if you want to bring anything I'll try to accomodate you _ might mean having a split-level meeting. Also bring ideas for attracting more members -- and also locations for meetings??

That's about all for now -- CU all on the 31st

Regards...STE
Bye for now...The Mad Pole

: seems to me to be the graphics memory being drawn from ST ram. I'd like
: to imagine that the Falcon is capable of the speed obtainable in mono,
: but in 24 bit colour :-)

It would be interesting to see if people who bought the Magnum RAM card
for the Falcon have a similar speed increase, since the Magnum board
supposedly treats the added memory as TT style Fast RAM, i.e., doesn't
share this memory with the graphics system, you use the first four megs as
ST RAM and the added Magnum memory as TT style fast RAM.

Of course, the stock Falcon only does 15/16 bit True Color, what is often
called High Color.

But if a Falcon could run in High Color at the speed it currently does
Mono... Mmmm.

I'm fairly sure that those last "cwait"s should be "wait"s, cwait is used when you want to stop the processing if the 2nd condition is true, those last ones have no 2nd condition, it might work but I think a normal wait is probably better.

Hello,

My Mega STE is behaving strangely. Does anybody have any idea about
the cause of this problem.

Turn the computer on and it works fine.
Some random time later it bombs out in a big way.
Turn the computer off, wait a little time
Turn the computer on and you get a blank display and nothing happens
(no atari logo).
Occasionally you get a colourful display with nothing happening.

Turn the computer off and wait a long time then it might start working
again!

The only two ideas I could come up with are a dry solder joint or the
atari gets too hot. The latter I think is a longshot.

Thanks for any ideas,
Robin

>it happened and I thought that you should know that it may be more

Somebody jump in and correct me if I'm wrong, but doesn't the CaTTamaran
only work with later revisions of the TT's motherboard and definitely has
problems with early ones...maybe this what happened to your friend... ;)

Some versions have an adapter that is required, and some do wire up
differently. They are not however, advertised to work on some models
and not others. Cyrel offered a little support if you had problems,
but generally you were left in the dark. I tried installing one on two
different REV's of TT's, both had the same results (bad). What I did find,
for those interested, was that the additional ST Ram cards caused
problems at higher bus speeds. It is simpler to just install a new
master clock to get a little more performance. Going over the stock
32MHz will render your SCSI usless, but if your using a Link, it will
still work (did on my machine anyway). 40MHz worked fine here. That
was with an Axit TT Ram card. A Falcon user with an Axit card reported
problems over 40MHz as well, so it may be the memory (or memory
latches such as on the Mega) that is the limit on the bus speed.

No chance that you could use floyd steinberg dithering as well?
It looks so much better and if it's done correctly (like in
1st-Guide) it's not slow at all. Atleast having it as an option
would be very nice. The extra work is worth it I ensure you.

You do also say that CAB uses the same 8 colours, but 1st-Guide
doesn't change the palette but uses the one available, CAB does.
In most cases the users doesn't change much in the pallete so it
doesn't realy matter. Maybe an option for this as well? Use
the available, or set the "default" boring palette.

Otherwiser CAB is a great program and you are worth all the
credid you can get.

Keep up the great work Alexander and keep CAB comming!

It sounds to me like one of your chips comes unseated when the computer heats up. It's probably loose. I had a similar problem with my Mega STE (I'd get stripes across the screen, and sometimes it wouldn't reboot when hot). The solution I was given--and which seemed to work--was to drop it a few inches onto a hard surface. This can reseat those loose chips.

I know it sounds a bit extreme, but it *did* work, and it was a suggestion made by technicians who worked on Ataris.

I've got quite a few things for sale atm. No swaps this time as I need
the money!

ST, Falcon, Jag, and Playstation Stuff!

ST Software:

I've got around one hundred games so if you are looking for anything
then I may have it.

ALSO...

Calligrapher Lite £10
Positive Image £30
NVDI 3 £10

Falcon Software:

Pinball Dreams £10
Gravon £10

Jaguar Games:

Doom £10
Kasumi Ninja £10
Evolution Dino Dudes £10

Playstation:

Worms £15
True Pinball £15

PRICES DO NOT INCLUDE P&P.
UK ONLY!

If you are interested then contact me via either email at
polonowski@zetnet.co.uk (prefered) or netmail 90:100/300.

Hi,
You may can use the Super fast Nova graphics card with 64bit graphics
engine. It can be populated with 2MB DRAM, 2/4 MB of fast VRAM.
You can get a speed up of upto or over 500%, while giving
you very high resolutions (upto 1280x1024) in 24bit true color modes
(i.e, on the SuperNova 64 plus)

To obtain more information, please contact Homa Systems House WEB
site at
http://www.magma.ca/~nima

or email at
aa414@freenet.carleton.ca

BTW, the Nova card only works if you have 4MB of STRAM and whatever
amount of TTRAM. If you have a 16MB STRAM board (which gives you 14MB
only!!), then you are unable to use the Nova card since there is not
enough addressing space.

Chris, can you tell us what model of ST it is? Its on the badge that sits on the upper right hand corner. If it is a 520 model, they are notorious for chip creep/and oxidation. This might sound funny to an non-Atari person, but a quick way to find out if you are suffering from this is to pick up the computer about 6 inches to 1 foot, and drop it (not slam) onto a very hard surface. If the problem goes away for a short time, then you will probably need to have the chips reseated/cleaned. If your disks are very old, they could be bad-but its not often that multiple disks go bad at the same time. Get a blank, DS/DD floppy (720k) and format it. Boot up from it. If the same symptoms are exhibited with the new disk, then its probably not the disks...It could also be the floppy disk drive going bad as well... :)

I'd advise getting a later model (like a Mega ST-STe/1040 STe) with newer versions of TOS and more RAM...the used market for Atari computers is very cheap now-to the point that anybody who really wants one, can have one... Good luck and hope this helps! :)

1870. ST Newbie experiancing problems

Newsgroup: comp.sys.atari.st
Date: 1997-08-13 00:00:00 UTC
From: Harmony Hill School <harmony@ma.ultranet.com>
Message-ID: <33F1E36B.36FD3850@ma.ultranet.com>
Source record: 118496

Hello Atari ST NG!

I am working on an ST computer for a friend of mine
She is computer illiterate, and just bought an ST so her kids
could learn to type.

She came to me a couple of weeks ago saying that she couldn't
get the computer to work; she said that when she switched the
computer on, she would see a bunch of bombs.

Now, I must say that I am not an ST user. In fact, this is the
first time I have actually ever seen an ST.

At first I thought that the bombs were possibly a virus, but the ST
does not have a hard drive (at least not an external one).

When I finally got around to booting up the computer, I was faced with
the scenerio that she had told me about...3 bombs on the left-hand side
of the screen about halfway down vertically. I tried a couple of disks,

and an ST wordprocessor started fine. From there I was able to boot
boot the computer and get into the OS without a problem. I was able to
view diskettes, etc...

Then I played a quick game of Xevious :)

Then I called her up and told her that the system was ok. She came up
from her office, and wouldn't you know it...the computer started acting
funny again. Diskettes that had worked before were now making bombs
appear. Most of the time there are 3 bombs, but I have seen 9 and 11
bombs also. Most of the time they are intact, but once or twice the
screen
has been garbled.

So anyway, does anybody know what is going on? If this is not the NG
to find the information in, could somebody point me in the right
direction?

Thanks in advance.

Chris

Dear newsgroup

I have had an Atari ST for quite a few years, although I only ever used it for games. However, I have recently done a degree in computing, am about to leave college and would like some way of keeping my hand in at C and PROLOG when I leave. I only want to write fairly simple programs, so am sure that my 520ST-FM will be sufficient. Can anyone tell me where I can download reasonable public domain C and PROLOG compilers that will fit within the memory of my machine? Also, where am I likely to find a cheap second-hand ST hard drive? And is there any way to pursuade my very underpowered system to run any version of UNIX (and if so, where do I get that from, too)?

Thanks in advance for your help

Nik

Hoi,

There is absolutely no need to copy the whole Everest stuff inside the
Oasis dir. Just copy your everest.inf to the Oasis dir. This should do
the job.

BTW: quiet a time ago the French oasis-connaisseur Bruno Kozlowski has
posted in c.s.a.st a message explaining how to patch Oasis so it does
find inf-files.
Go to http://www.dejanews.com and search for
853354824_OASIS_@nordnet.fr (15 jan 1997)
I don't know if this patch works but one could give it a try.

Source record: 118502

Can anyone shed light on these problems, please?

1) In MagiC's desk, why do the partition icons gradually migrate to the right and eventually tramp all over themselves, nearly off-screen?

2) Is it possible, as under TOS (TT) itself, to open partitions without their icons being present on the desk? I have tried without them, but Magic doesn't recognise the partitions without them. Its a nuisance, for they do take up precious memory.

Thanks,
Charles.

Do youhave the flags (in your .ppprc) :
modem
silent

(I got rid of these lines with -bsdcomp, but you said that you have
tried. Maybe too old pppd? you shoudl get the latest anyway.)
bye.

>
>Bye Harry,
>/Pascal/

Hi Pascal,

I missed the orignal post, but I do use NVDI/MutiTOS/MiNT1.14/etc. on my 14meg Falcon with few problems. Here's the last files in my Auto folder setup:

nemesis.prg
wdialog.prg
jpegd.prg
nvdi.prg
nem_hi.prg
hrtc.prg
drvin.prg (or fastserial)
scc.prg
mintnm.prg (mint v1.14 notice nm)[LAST]

Aren't Auto folder setups fun :) Obviously, there is a load of other prg's before these, but this does work for me.

Regards,

Charles

I believe Atari merged with a company called JTS around 1996. There is now no Atari branch producing computers, but instead the company now specialise in data storage and arcade game machines.

BTW, if you wanted an OS upgrade, why not get MagiC or Geneva?

Cya!

Yes the TTM195 was originaly designed for use with the TT but it's
possible to use a TTM195 (or TTM194) with a Mega ST4. You need however
some kind of interface to connect the 19 inch at the Mega 4.
That's is all I know.

This sounds like you have a poor connection somewhere between the monitor
port and the monitor. Sounds like the ST thinks you've unplugged the monitor,
the mono detect line breaks which makes your ST reboot.

Speak to 'ya later!

Hello,

I'm in the market for a working 1040ST, with hi-res grayscale monitor. I have several Atari floppy disks that I would like to transfer to my Pentium PC system; unfortunately, the disks were formatted on the 1040.

I need to get these disks into PC format, but I'd also like to do some experimenting with a 1040 (or Mega) and want to buy an ST or Mega.

If you have a 1040 to sell, or you'd be willing to let me have the use of it for fifteen minutes to copy the floppies, and you live in the immediate Tucson area, I'd like to hear from you. Thanks!

Regards,
Thom Gandet

There are at least two CD XFS drivers for MiNT. Steffen Engel's CDROM-XFS
talks directly (thru SCSIDRV) with the drive. SPIN! however uses the
XBIOS part of MetaDOS (METAXBS.PRG).

: You just have to remember the /relevant/ data from the form, i. e. the
: user input. Almost every CGI-script uses the same trick: No matter if
: you receive your form input with a GET request (in the environment) or
: with POST (from stdin) you access the data from the same location in

I accidently stumbled upon an interesting example of how this actually _does_ work in CAB. Remember, our example for this thread was a search using Alta Vista. The complaint was that, when one does a search and gets a page of results and follows on of these links and then clicks on the "Back" button in the browser, one is sent to the Alta Vista home page, rather than the actual previous page, the search results page.

Well, yesterday, I used the history list to go back specifically to the Alta Vista search results page, and it worked perfectly. Why it should work properly to go back using the history list and not work properly to go back using the "back" button, I do not know. I wish I'd had more time last night to experiment with it. (I'm using commercial CAB 2 with OVL 1.2618).

I still think it would be worth a couple K of drive space to record the contents of forms, as there are many times I would like to be able to go "back" to forms that are complex and don't encode the form contents in the URL, as Alta Vista does.

: Every tiny GIF thumbnail wastes more memory than that.
: I think a cache of 4k or 8k would be more than enough to remember the user
: input from the most recently visited sites.

Which brings me to another problem I'm having with my current copy of CAB that was not a problem with v 1.5, and that is, I can't get the RAM cache to do any good. Every GIF is now being loaded off the hard drive evey time it is displayed, no matter how I tweak the cache settings. A good example of my problem, again from the Alta Vista search engine, is that line of 20 blue buttons near the bottom of each search results page. Under CAB 1.5, those all display almost simultaneously. Under 2.0 they appear one by one, with my drive working feverishly between each. Is this

just a minor bug that was introduced in 2.0?

1897. Best Electronics REV. 10 catalogs

Newsgroup: comp.sys.atari.st
Date: 1997-08-14 00:00:00 UTC
From: "Mark W. Herber" <markh@cts.com>
Message-ID: <01bca90a$21f06120$04c2d8cc@datel451.cts.com>
Source record: 118299

The Best Electronics Rev 10 catalogs are now available.
So what you ask?
Best is one of the few places you can get parts for your Atari. And most of the others probably buy theirs from Best. If you are like me and are trying to keep the old ST alive for a few more years (in my case a Mega STE) then this catalog is invaluable. Some upgrades and a few programs are also listed in the catalog. The catalog also covers 8-bit Ataris and the game systems. Service is very quick. I mailed away for mine last Saturday (8/9) and got it this Wendsday (8/13) via USPS Priority mail. The catalog costs about $10 postage included plus sales tax if you live in California.

The address is

Best Electronics
2021 The Alameda, Suite 290 (yes, that is correct)
San Jose, CA 95126

Just thought I'd let you know.....

mark

Just as an aside - I personally think x2 will lose out in the end. In published benchmarks, it never achieves 56kbps throughput on real-world phone lines anyway. K56Flex gets much closer to the claimed performance.

As far as serial port speeds - for a pair of modems that are configured to use compression, you really want the absolute fastest serial port rates you can possibly achieve on both ends. Even though with K56Flex your uplink is maxed out at 33.6k, and downlink maxed out at 53k, the compression can get 2:1 or 4:1 (or even more) for some kinds of data. So, let's say you are FTP'ing a text file that can get 4:1 compression. If you are uploading, then you want to send the file from your computer to the modem at 134.4kbps, because the modem will then compress it and transmit the compressed data at 33.6kbps. If you send the data from the computer at slower than 134.4kbps, your modem will not be forced to run as fast as it could - the transfer will take longer, and the line will actually be idle part of the time. Likewise, the receiving computer will need to run its port at at least 134.4kbps, because when the receiving modem uncompresses the data, this is the rate that the data will get spit out. Unless the computer is too slow, and has to flow control the transfer - again, the transfer will take longer and the modems will not be utilizing the line to its full extent.

It's not that you won't get a "good connection" at slower speeds. But hey, if you're willing to tolerate slower speeds, then you didn't need to buy such a fast modem to begin with. Why are you wasting your money and time?

Hello everyone,
I would like to remind you of my homepage, where you'll find facts about myself and my studio, as well as magazine articles that I've written and a trouble shooting section about the Falcon and various hardware problems - both with Cubase Audio and others.
Visit my homepage - or if you don't have web access, you can send me an e-mail and I'll try my best to help you out.
BTW, my old addresses that are at "dada.ct.se" don't work anymore because of the closure of the BBS "dada".
Best regards,
Claes

1900. Tool for GIF animations available

Newsgroup: comp.sys.atari.st
Date: 1997-08-14 00:00:00 UTC
From: Guido Flohr <gufl0000@stud.uni-sb.de>
Message-ID: <5sthqm$i97@hades.rz.uni-sb.de>
Source record: 118302
Cross-posted to: comp.sys.atari.st,fr.comp.sys.atari,maus.sys.atari.software

Hi!

I've compiled gifmerge for TOS. Gifmerge was written by Mark Podlipec and Rene Mueller. It is a little tool that creates animated GIFs from a series of (GIF) images.

To prevent an uproar among those Atarians that don't have a shell with input/ouptut redirection I've added a new option `-o' that allows to specify an output filename (by default gifmerge simply writes to standard out).

I've also added an example animation including the underlying single images. Unfortunately I haven't managed to make CAB display the animation in transparent mode (although gifmerge allows you to specify one color to be transparent). I'm not sure if this is a bug in gifmerge or in CAB. Maybe you're more successful than me...

I've uploaded the archive as

ftp://ftp.cs.tu-berlin.de/pub/atari/gifmerge-1.34b.tar.gz

As soon as I know the final location I will also install a download link on

http://stud.uni-sb.de/~gufl000/atari/

Just in case... I've only /compiled/ the thing, I probably can't answer you any technical questions besides the usage. AND: if anybody asks me for a GEM interface I will trade her/his e-mail address to the world's biggest junk mail spammer!! See http://www.aolsucks.org for details. ;-)

Ciao

Guido

P.S.: Be careful when replying! This is a cross-posting!

I would use Sozobon C, available for example at

ftp://ftp.fu-berlin.de/pub/atari/???

If you also install Gemini (an alternative Desktop) and Mupfel (Gemini's
Shell) you already have some Unix feeling.

> ...And is there any way to pursuade my very
> underpowered system to run any version of UNIX (and if so, where do I get
> that from, too)?

Available Eunuchs-Clones for Atari are

- Linux (only TT/Falcon)
- NetBSD (only TT/Falcon) and
- MiNT which runs on all Ataris and is quite small. There's also
a "plug & play" distribution called KGMD (partly German) resp. KEMD
(mostly English). The biggest advantage of MiNT in my eyes is that it is
almost 100% compatible with TOS (only some hacks refuse to run). With a
multi-tasking AES you even won't miss to many features that you might like
from X11.

Anyway, even for Sozobon C you'll probably need more RAM and a lot of
patience and cleverness to do something useful if you don't have a hard
disk. For the Unix-clones I mentioned you'll definitely need a hard disk
and at least 4 MB RAM.

You should consider to buy a used TT or Falcon. This is probably already
cheaper than buying a hard disk for you ST (because for your ST you'll
need a "host adaptor"; the TT has a SCSI port). At least the TT (I don't
know the Falcon) can also be upgraded with the standard PS2/SIMMs which
makes it cheaper again in the end. Don't forget: You wouldn't expect a
286 to run Linux with X11, would you? Your ST is probably of about the
same age...

Ciao

In my opinion, no. These are pretty normal opreations. If you want
some really frustrating eccentricities w/regard to floppies, try Windows
3.1 file manager, or Mac OS.

I keep a floppy disk in drive A: when booting, which has a virus guard
function, and my net text files, addresses, etc. on it. Once booted with
this floppy, if I put in a disk with a virus, the screen will flash,
hopefully before any major damage is done.

You just have to remember the /relevant/ data from the form, i. e. the
user input. Almost every CGI-script uses the same trick: No matter if
you receive your form input with a GET request (in the environment) or
with POST (from stdin) you access the data from the same location in
name/value pairs. Every tiny GIF thumbnail wastes more memory than that.
I think a cache of 4k or 8k would be more than enough to remember the user
input from the most recently visited sites.

1905. SyQuest EZ Flyer problem

Newsgroup: comp.sys.atari.st
Date: 1997-08-14 00:00:00 UTC
From: ai063@FreeNet.Carleton.CA
Message-ID: <5stltj$h1m@freenet-news.carleton.ca>
Source record: 118307

I recently purchased a SyQuest EZ Flyer (230Mb replaceable cartridges). But I'm having a strange problem copying certain files to the formatted and partitioned drive. (Three 73.3 Mb partitions) I used HDDRIVER 6.01 to format and partition.

When I copy LDW Power, Diamond Back 3 and Protext 6.5 (word processor) from another hard drive or an original floppy to the SyQuest, these particular programs won't load from the SyQuest. I usually get 2 or more bombs and a return to the MaxiFile dialog. If I delete Maxifile and copy from the desktop, I get the same problem. I tried copying via Kolbold and got the same adverse results.

Not only will the copied .PRGs not run but they show differences from the original files and have different check sums. This was established using Eric Monaco's FCPU program--even tho' the number of bytes show up as the same as the originals. The files appear to be corrupted somehow by the copying function.

I tried to "see" the differences using DADE from Diamond Edge, but the "texts" were too complex to see any apparent differences, because I could display only one file at a time, that is I couldn't do a side-by-side comparison.

Many programs, including Diamond Edge, MBrowse, Kobold Demo and STD_CAT copy OK and work from the SyQuest.

I'm stumped. Is it a problem with the SyQuest? A problem with the copy functions of TOS, HotWire/Maxifile, Kobold. Or with my 1040STe?

I have a Seagate 80 Mb HD as ACSI 0,0 and the SyQuest as ACSI 5,0. The Seagate is drive C, the SyQuest is drives D,E and F. Is this causing a problem? The Seagate works fine and loads all the programs without a problem. The 1040STe has 4 meg of RAM and I have lots of spare memory to run the programs--HotWire shows 1.7 meg of RAM after everything is booted up.

I'd appreciate help and suggestions from anyone who has had experience with this problem.

Please send replies to my e-mail address, since I always seem to be way behind USENET messages. I'll gladly post the "winning" response.

If you have TOS>2, you can open partitions with either Ctrl+[drive]
or Alt+[drive] without having the drive-icon installed on the desktop,
with Magic I don't know, but I suggest you only have the U-icon installed,
from there you can access the other drives.

Interesting.
Idea:
What about using Outside (by Uwe Seimet) on the Falcon.
This program can configure your ST Ram as TT and ST Ram.
So I could configure Outside for 4MB ST Ram, 10MB as TT Ram, and the
hard disk as whatever (100MB Ram?) Virtual TT Ram I needed.
Would that work Nima?
Have you used Outside?

1909. AIXIT UNRELIABLE!!

Newsgroup: comp.sys.atari.st
Date: 1997-08-14 00:00:00 UTC
From: pettert@notam.uio.no
Message-ID: <5sv7fl$189$1@ratatosk.uio.no>
Source record: 118311

BE WARE OF AIXIT

Some weeks ago, a user questioned the reliability of Aixit GMBH in Germany. I'm sorry to have to report a similar bad experience with the company.

I installed a Nemesis card in my falcon a couple of months ago, and it turned out that the Magnum fastram card would not work with the highest Nemesis speed.
After a few email exchanges with Aixit, they told me they could burn a new chip for the Magnum that would take care of the problem. Aixit was at this stage very responsive to emails - I usually had their replys the next day.
So I sent them the money for the chip (40DM) and waited. 10 days later (and no chip) I sent another mail asking them if they'd received the money. They confirmed, and said they would burn the chip the same week.
2 weeks later I had still not received any chip, so I sent yet another mail asking for it. Aixit replied that they had made a mistake, and that it wasn't possible to fix the problem.
Since then, I've sent Aixit 3 emails asking them to return the money. Aixit hasn't replied to any of these mails...

So the lesson seems to be: Don't send money to Aixit before receiving the product!!!

> computer about 6 inches to 1 foot

It really needn't be this far. 4 or 5 inches should do. If you are a bit squeamish about "lift & drop", you can (tediously) open the case (about 8 screws on the bottom, don't undo the ones in "square" holes, they hold the disk drive in place. Note some screws are shorter than the others; they go into the front holes, so that they don't poke allthe way through the top of the case when you put it back together. You have to pull the case away to clear the disk drive button, then lift it up, and use pliers to turn the metal tabs to remove the shielding. Then rinse your hands with running water to ground out any static, don't wear polyester socks and dance on a shag carpet, go back to the ST and push down firmly on all the socketed chips. If you hear a slight crunch, they were loose. You MIGHT wish to pull them(carefully) and then reseat them. This takes about 1/2 hour the first time you do it, and often cures the problem for months.

With Toad out of the Atari computer business, I've noticed an occasional question about who Atarians can contact to purchase new software or hardware in the US. There's been a mention or two of Systems for Tomorrow. (SFT) Since SFT's not as well known as Toad, I thought I'd write up a quick note on what SFT is. NOTE: This is *thoroughly* un-official!

Systems for Tomorrow is a store in Independence, MO (Kansas City area), owned by Kent Kordes. He's had the store (in several locations) for something like five or six years. He sells new and used Atari and Amiga hardware and software, both locally and mail order. Just within the last month, he's obtained the right to sell software upgrades on NVDI, Magic and HD-Driver. He also has Jaguar and Lynx cartridges for owners. The store's website is utterly plain, but is gradually getting more information available.

The store is open Tuesday through Saturday, for anyone who's ever passing through KC and wants to look him up.

Being fortunate enough to have a local store, I can't compare Kent's mail-order business to other Atari mail-order firms. I will say he's a very nice person, he's been in the business quite a while, and I suspect he'll been in the business for quite a while yet. I would certainly recommend SFT for anyone looking for Atari or Amiga stuff.

SFT's website: http://www.systemsfortomorrow.com

Robert Schaffner wrote:

> wdialog.prg ------------> (You need that WITH NVDI) ?!?!

Shure. Wdialog just adds MagiC AES calls to other TOS Systems. I guess
you mix it up with Enhancer witch adds off schreen Bitmaps to the VDI.
You don't need that with NVDI, because NVDI has it built in.

If C-Labs got the right to create Falcons, why didn't they utilize some of the aspects of the MicroBox? That was supposedly supporting a 32bit bus.

Hi people :o)

Just a quick post to say a big 'Thanks !' to everyone who replied to me about getting a Scanner for my Falcon :o)

I haven't actually got one as yet, but I'm looking into a few possibilities so, to those who wanted to know how I got on, I'll let ya know, OK ? :o)

Thanks again,

See ya,

Mark.

My guess is that the Hades would be the most ideal TOS computer for emulation purposes. Also, it is probably a good machine to focus on creating PCI/ISA drivers for TOS/MiNT/MagiC.

Message-ID: <871599668_OASIS_@jaubrey.demon.co.uk>
Source record: 118323

I recently brought a 2nd hand of Micro German, imagine my dispair when I noticed it was writtain in STOS(I have nothing against STOS programmes like HERO from Mr Greenwood), not very well done, when the screen clears, the F keys blink, and the annoying key click is always on. The source code is included as well as the seperate modules, but it is so slow, even with HD! Is there anyone out there willing to compile it for me to a stand alone prg file? I don't know how to do this my self. It is a commercial programme but I think 'LCL' have long derserted the Atari scene, so zipping it up and sending it for alteration for ones own use won't matter so?

Thanks in advance,

James

> on six chips I can give you (plus postage). Let me know.

Actually, the sockets will be at least partly filled, as these old ST's had a
very small ROM whose sole purpose was to look for a boot disk and load TOS
into RAM.

However, Dennis, maybe you have another problem. Have you tried waiting a few
for the desktop to come up by itself without booting from disk. Most ST's behave this
way. If it does, then your problem is somewhere else, maybe the drive.

Anyway, if you're not too familiar with ST's , take a look at the Atari ST Quick FAQ:
http://www.geocities.com/MotorCity/2090/quickfaq.html

> would be very nice. The extra work is worth it I ensure you.

Well, Floyd-Steinberg can never beat ordered dithering when speed is concerned. Concerning quality I don't know anything better than Floyd-Steinberg. Maybe another swich is requested here. Those with 16Bit High Color may get real good quality with ordered dithering and not use all the time needed for Floyd-Steinberg. Those with 8bit pallete may then use Floyd-Steinberg (and maybe an optimized color palete, not only the network standard; how about octree over all colors used on the whole page reducing to 240 Colors (the first 16 should stay); another optional swich...). Those with 4 or less bit use the fixed palette and the user may swich on Floyd-Steinberg or use ordered dithering.

On the other hand all those small features someone once requested make an application huge. May be Alex whants to implement another module interface here. In the configuration dialog there could be a popup with all the names of the found modules. Cab only has to load the code the user really whants to use. (I like the idear of modularized software... I hate to waste memory for features I don't use.)

Another possibility to make almost all users happy is to use something like OLGA ID4 or VIEW Protokoll to view the images. I don't really remember the definition of the VIEW protocoll, but may be that is a possibility (use all the dithering features of GEMVIEW...).

Maybe (most likely) people whant to use a different dithering scheme on the printer. Hm... another option is arising... really looks best to use external modules. Doesn't GEMVIEW use dithering modules? Is it possible to adapt that interface?

> You do also say that CAB uses the same 8 colours, but 1st-Guide
> doesn't change the palette but uses the one available, CAB does.
> In most cases the users doesn't change much in the pallete so it
> doesn't realy matter. Maybe an option for this as well? Use
> the available, or set the "default" boring palette.

Hm... I don't really like programms that change the reserved palette (first 16 colors are fixed by DR, I think). The whole look of the windows, desktop, etc. is corrupted. You should leave the first 16 colors alone (use them in you dithering function, but don't change them).

> Otherwiser CAB is a great program and you are worth all the
> credid you can get.
>
> Keep up the great work Alexander and keep CAB comming!

Yes!

|> Tom Lamparty (lamparty@concentric.net)

Hi Tom,

thats the problem. I have absolutely no experience
with atari. I gave my HP laserjet 4L to a friend
of mine. She has an atari computer. I do not know
what kind of software she uses and I can not
ask her at the moment.

So my idea was, that there must be a standard software
on such a computer like MS-Windows for a pc ?

And therefore I thought about a printer driver.

From the docs of a new 8-bit emu:
---
this is the Atari 800XL/130XE emulator for Atari Falcon030/040.
It was written by David Firth and ported to Falcon by me (Petr Stehlik).

e-mail stehlik@cas3.zlin.vutbr.cz
WWW http://ft3.zlin.vutbr.cz/stehlik/home.htm

I couldn't get it to run any 8-bit software, probably because I don't have
a clue as to what options to use. I had a C=64 back then :-)

> I think there's something about MAC and IBM 286 being emulated maybe
> with hardware additions?

Spectre is the Mac emu, I think there are versions w/ and w/out the cart.
Falconspeed is the 286 emu card for the (what else) Falcon.
I saw someone in here selling a MegaST 386 emu. Never heard of that
before. Then there is SoftPC. I think its Falcon-only. I could never make
a 10meg disk with SoftPC so I dumped it. It did work with the 1meg disk
that comes with it.

DLD> the latest version of ConNect would do nicely for the software.

There is also Starcall that is supposed to work (voicely speeking) with at
least Zyxel and Creatix modems. But I don't own a voice modem myself, so I
cannot tell which is good and which is not.

1934. 19' (or 17') monitor for ATARI Mega ST 4 wanted

Newsgroup: comp.sys.atari.st
Date: 1997-08-14 00:00:00 UTC
From: Andrea Centazzo <deepmusic@mindspring.com>
Message-ID: <33F2E321.74D6@mindspring.com>
Source record: 118514

I'm looking for a ATARI TTM 195 monitor or similar to use with MEGA
ST4 and/or my Stacy.
I'll consider alternatives also like 17' or compatible monitors .
I need just monochrome and hi-res. since I'm using Clab NOTATOR
software only .
I need also a cable connecting the monitor to the old ST/STACY monitor
in.
Please help me if anyone has some to sell.
Andrea Centazzo

From: dhedberg@aristotle.algonet.se
Message-ID: <5suqq3ovh1@zingo.tninet.se>
Source record: 118516

Hi,

: Okay, now I'm confused. I don't know of any STe's or Mega ST's that have
: LAN ports. Mine certainly doesn't... Is there a way for Universal Network
: to add LANs? I thought that the only way to network ST's, STe's, and Mega's
: was via MIDI or cartridge port, while the Mega STe, TT030, and Falcon all
: had the LAN ports... Thanks in advance for any info! :)

Universal Network uses the cartridge port on computers with no LAN port.

All the best,
Daniel

> Magic doesn't recognise the partitions without them. Its a nuisance, for
> they do take up precious memory.

Well, I have no idea, but one idea would be to only use drive U: and
remove
the others. I'm not sure the key short cuts will work though (if you
call
the need of pressing 3 keys at the same time a shortcut...).

Alternative you make a new very small drive icon which doesn't take up
as
much space and use that insted.

Or you just junk MagXDesk and get another better desktop.

look at

http://ftp.tu-clausthal.de/pub/atari/languages/prolog

> If you also install Gemini (an alternative Desktop) and Mupfel (Gemini's
> Shell) you already have some Unix feeling.

For MiNT there are also the most UNIX shells available (tcsh, bash, ash,
pdksh and I think zsh).

> Available Eunuchs-Clones for Atari are
>
> - Linux (only TT/Falcon)

Very good, but needs very much RAM (more then I have in my Falcon).

> - NetBSD (only TT/Falcon) and

I have no experiance with that one, but it is said to be rock solid and
to have an extreemly fast TCP/IP stack.

You missed MINIX (no experiences with that one as well) and Atari SVR7
(may be you can get a used copy somewhere. They really sold a few
copies).

MINIX is written by one of the big OS gurus, Andrew S. Tanenbaum. The
latest Version for 68K machines is 1.5. It can boot with 512KB. To work
with it it will need 1MB (I guess there is no X11 in this calculation).
Look at http://harmless.rrnet.com/Minix/Info_Sheet.html . I don't know
where to download it.

I don't know much more about Atari SVR7 than just that it exists.

> - MiNT which runs on all Ataris and is quite small. There's also
> a "plug & play" distribution called KGMD (partly German) resp. KEMD

> multi-tasking AES you even won't miss to many features that you might like
> from X11.

I guess you will need to pay for the Multitasking AES if you like the
stability of the old TOS (sorry, Creig and Christer, but...). XaAES

won't like my Falcon (crashes every few minutes) and oAESis is said to be more stable(I have not tried myself), but not like N.AES (the comercial possibility).

> You should consider to buy a used TT or Falcon. This is probably already

> know the Falcon) can also be upgraded with the standard PS2/SIMMs which
> makes it cheaper again in the end.

The standard Falcon from Atari needed a special memory module, but there are adaptions available that let you use PS2/SIMMs in the Falcon (up to 16MB and up to 14 of it is usable). There are also TT RAM expansions available. AFAIK the TT needs old SIMMs not PS2/SIMMs (as long as you don't have a 3rd party RAM espansion card). Atari built two RAM slots in the TT (one for ST ram and one for TT ram). AFAIR Atari had cards for these slots that use the old SIMMs.

I don't have Lattice, but I can tell you that PureC produces faster and
smaller code in less time than gcc. It seems this is because gcc is
portable and gives away loads of speed to test the plattform it is
compiling for. Still I use gcc for bigger Projects, because I like to
use C++ which none of the other development environments on the Atari
give me.

> > I won't waste my time with Pascal adaptions! There are better things
> > to do (see above).
>
> So it's not possible to link c object files woth Pascal?

No problem with PureC and PurePascal. Both use the same object file
format (and therefore combatible linkers). In PureC I can configure
calls to single functions, and function calls in general (all the
others) to either use Pure calling convention, Pascal calling convention
or C calling convention. I guess, that PurePascal implements the Pure
calling convention as well; if not there must be at least Pascall
calling convention available. So it is no reall problem to link C
libaries with Pascal programs. You just need to write Pascal include
files.

In GNU developping environment there is P2C avaliable that converts
Pascal code to C code. This is not optimized, but gives the possibility
to integrate Pascal with C.

The Standard is GDOS (NVDI e.g.). The problem is that many (mainly old)
programs don't use them. They like to do everything by themselves, miss
the quality possible with newer printers and waste a lot of Memory...

In general I sugest everybody to use software that is at least able to
print via GDOS.

What model is it? E.g., Goldstar, Samsung, JVC...? If you can't find an
external adjustment, some models have "pots" inside the back cover that
you can play with. (you'll have to remove the cover though)

WARNING Make sure its turned off and unplugged, and be advised there
are things inside there that hold a -charge- and can change your religion
and sex if you are not careful and get hold of them...!!!! <smile>

> My next computer *will* be a PissY running Winbuggs97...

Well, I feel sorry for you! <smile>... You know, its funny, but this is the
first "doom and gloom" message I've seen posted in a long time. Things have
pretty well stabilized around a select core of vendors/users, and they seem
to be pretty content where they are. Don't get me wrong, things could be a
whole lot better, but somehow, with my Jag/Lynx combo doing games, and my
Mega ST 4 running my BBS, and my Falcon covering my own personal needs, I'm
pretty content. Software is coming out too-mostly shareware/freeware but
some commercial stuff too...and it is inarguably the highest quality that
we've ever seen... Heck, I've been in the Atari scene since 1983 and I'm
gonna stick around just to see what happens next! :)

PS -IF- everything Atari disappeared overnight
(and it won't!), and all my machines broke
down, my last Best power supply failed, and
there truly was no hope left, I'd turn to
our still rebellious cousins, the Amigans!

(and I'd still keep all my Atari literature,
magazines, and books-to remember with honor
all that was-for there will never be another
time/feeling such as Atari managed to convey
to so many users...)

Emagic's Notator Logic is also a very good sequencing program for the St.I
used it on my color monitor in medium res. and it worked fine and I also
used it with Sebra (high resolution simulater) on a color monitor.The score
editing feature is actually a lot better in Logic because you are able to
view a whole page at a time.

From: dlormand@aztec.asu.edu
Message-ID: <5svbfl$rbk@news.asu.edu>
Source record: 118526

For what its worth to you guys,

I heard about the "drop shock treatment" before, but that seemed to me undignified for a fine piece of computing hardware. So when I have gotten STs via mail order (and they invariably refuse to work correctly, the symptom being intermittent bombs upon trying to read the floppy upon power-up), my treatment is to take the cover and keyboard off (observing reasonable static discharge precautions, like touching a piece of grounded metal, like the chassis of my TI, at intervals) and using a small screwdriver or Xacto knife to pry up ALL the socketed chips COMPLETELY out of the sockets and then plug them back in. This seems to defeat any cumulative oxide buildup problem, and the machines work just fine long afterwards. Sometimes I have to do the chip reseating maneuver two or three times to get it's attention, but it has not failed yet!
(Note, that's unplug and reseat each chip at a time, not unplug all of them and then try to figure out who goes where!)

Actually it might be easier to use a PC emulator if its a DOS program and the whole set of files is less than a meg. PCSoft works well for DOS and its just software. To run Mac on an Atari you need Spectre. Thats commercial and might not be still available or supported. Then you have to buy the Mac roms for it.

Well if you have a decent computer and use decent alghoritmes it
shouldn't
be any problems. Ofcourse an option would be the best idea, but it
should
realy be there.

> High Color may get real good quality with ordered dithering and not use
> all the time needed for Floyd-Steinberg. Those with 8bit pallete may

> I hate to waste memory for features I don't use.)

Ofcourse modules would be perfect but adding floyd steinberg can't make
it
that much biiger.

> Another possibility to make almost all users happy is to use something

Sounds like a good idea. Atleast put it in modules if it's possible.

: Anyway, what I was wondering was if anyone ever got their hands on TOS 5.0

Rumor has it that Wizztronics is buying/has bought TOS from Atari/JTS.
What they'll release is anyone's guess.

: I know that it would finally be nice to run True Color mode on a VGA
: monitor! I'm also looking for anything that would make the Falcon that I

You can, just in 40 column mode. Or get Nemesis. A fantastic upgrade
that speeds your Falc' up half again its original speed, allowing True
Color in 80 column mode.

>resolution, no more than a .28mm dot pitch, and priced no more than about $300
>
>Any suggestions?

Terry, if VGA is all you want, there are a ton of monitors scattered through
-out mags like the Computer Shopper that will fit your bill...However, if you
are wanting backwards compatibility with older TOS programs that run RGB (I
mean 15khz) then it becomes a lot harder. I'm using a Nec 3D, at 640 x 480
but I can get 800 x 600 with Videl Inside, but its squint city. Amitech (an
Amiga brand) makes a 14" and a 17" model that is perfect for the Falcon with
all its res./modes...However, they are a little expensive... :)

: BE WARE OF AIXIT
: ----------------
: Some weeks ago, a user questioned the reliability of Aixit GMBH in
: Germany. I'm sorry to have to report a similar bad experience with the
: company.

That person would have been me. My problem was that the AixTT card
that I paid for never arrived at all. Aixit got my address wrong, despite
me giving them my correct address at least FIVE times, so presumably this
is why it did not arrive. After a while, I told them that the card had not
arrived and that this was presumably owing to the incorrect address, and
they said that they would send me another card to my correct address and
email me the date on which it was shipped. This was about a week ago, and
I have yet to hear from them.

I hope the card just turns up eventually.

: So the lesson seems to be: Don't send money to Aixit before receiving
: the product!!!

So it would seem, unfortunately.

It's a pity that a company that makes what seems to be such a good product
(I have heard lots of good stories about the product) turns out to be so
unreliable.

If the card does arrive, I will certainly post here about it.

1962. Ghostrscript printing to SLM804 or to file - how?

Newsgroup: comp.sys.atari.st
Date: 1997-08-15 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <1RFPCHE@tos.pl.net>
Source record: 118338

I have been trying to print an Adobe Acrobat PDF file on my Atari SLM804
laser printer using the GEM version of Ghostscript without much luck.

The page seems to display reasonably well onscreen, but when I select
SLM804 as the output device, then choose print from the file menu etc.,
the usual messages about loading fonts etc. appear, but nothing is
printed.

Even the onscreen display is often not quite right - usually images get
black horizontal bands and sometimes gaps appear in the text
(like this).

To summarise, I am having problems where the onscreen display of the page
is incorrect, and where the page will not print on my SLM804 at all.
I don't know whether the inaccuracies present in the onscreen display
would affect the printed output, however.

If the printing problem cannot be solved, it would be sufficient to be
able to output the bitmap to a file and print it later, but I was unable
to find any way of saving the Ghostscript output to any kind of standard
bitmap image file.

(I did run the Diablo emulator as explained in the Ghostscript Atari
documentation, although since I have not used the Diablo emulator
otherwise, it is possible that I may have not operated it correctly.)

Any help would be appreciated.

Cl> music, also dtp, word processing, internet, and games.

Wow? Are there that few Atari enthousiast left then in the Seattle area?
I think Butler Computers (are they still called Butler's?) can do the
repair too, I think. Once this shop sold only Atari related stuff.
Now they're switched to PC too. But they still do something with
Atari I believe. They are located in Federal Way, close to a big
shopping mall. They are next to Jack in the Box.

We've lived in Burien for more than 2 years :)
We were studying a 4GL over there in 87 or 88.
Since then we go back to Seattle every 2 years or so.
There was/is (?) this big usergroup called S*P*A*C*E, do they
still exist (Seattle Puget Sound Atari Computer Enthousiasts)?
They had a lot of 8 bit users (amongst me), and enough ST users.
Maybe they can help too? Look in this free computer mag you can pick up
at Safeway, there you're able to find where they meet.

We visited Xanth a lot too. The shop wasn't that big, and it was
a little bit more expensive than SB computers or Butler's.
Anyway we love Seattle/Washington State.

Bo.

what is it?.. a game or summat ?

>it is so slow, even with HD! Is there anyone out there willing to
>compile it for me to a stand alone prg file? I don't know how to do

Two fings, first off, if its not compiled then possibly an older version of STOS and uncompilable,
Another reason for none compiled programs is the way variables are saved, STOS has a real easy save "filename.VAR" function that saves the information for every variable used in a program, and an accompanying load command, real easy, but only works in BASIC format, so a total program rewrite would be needed, following and saving all the variables (Nightmare!)

However it may be none of the above and simply that the author didnt have a compiler (they are hard to get nowerdays)

Send it me, I will have a looksy.. email it to worden@airtime.co.uk as that gets checked after 6pm :)

Don;t bother trying to do this. C-lab NOTATOR SL (1.0 up to the last release 3.21) does not, never did, and can never be made to drive a resolution larger than 640 x 400.

calamus 1.09N Will be a pleasure on this modification, however. Also you might consider upgrading to Notator LOGIC: it is more flexible in regards to clock speeds, caches and resolutions. You can import your old .SON files into LOGIC and re-save them, so you won't lose your work.

Pot calling the kettle black: I'm still using Notator SL on an SM147 mono monitor myself! I too have 32mHz/19" moniterm envy!

From: lynxpro@aol.com
Message-ID: <19970815051700.BAA22728@ladder02.news.aol.com>
Source record: 118353

Hey everyone,

I've really been out of Atari computers for about a year now, ever since I came to the reality that there was no escape from the computer industry nightmare known as Wintel.

Anyway, what I was wondering was if anyone ever got their hands on TOS 5.0 after the collapse, ahem, merger of Atari Corp. with JTS? From my understanding, TOS 5.0 had been completed, but never got released since Atari decided to drop computers around 1995 for full concentration upon the Jaguar. Now since I've seen pictures of the Falcon040 that was in the Atari shop, I believe TOS 5.0 was completed. So, has anyone got ahold of any copies?

I know that it would finally be nice to run True Color mode on a VGA monitor! I'm also looking for anything that would make the Falcon that I have seem like it is worth keeping around.... I'd really like to find Steel Talons, Road Riot 4WD (as well as Space Junk) for a decent price (and not the $50 retail which is totally unreasonable)..... Looking back, I wish I would've copied all those games from the SacExpo in 1995 (either 95 or 94, I can't remember now) when Atari had all of those running on a demo Falcon with nobody watching the system.....damn ethics! And where's the warez section for Atari stuff???

Anyways, thanks in advance.

Jeremy

You didn't mention how you upgraded the memory, but if it was with a
Marpet X-tra Ram card, go back over the connections. Especially the
connector that plugs onto the large PLCC chip. This definetly sounds
like a memory problem. It is a pain, but not to much work to remove
the Marpet connectors, resolder the resistors and try running with one
meg for a while. The first few I installed caused simular problems. It
was hard to identify the problem connection, but after reviewing the
installation a few times, the memory problems went away for me.
The next suspect would be Warp 9, but I remember it to be fairly
stable on TOS 1.02.

Check the mouse connector solder joints on the keyboard PCB. Reseat
the keyboard processor chip. Check for sticking keys.

1983. Monitors for Falcon

Newsgroup: comp.sys.atari.st
Date: 1997-08-15 00:00:00 UTC
From: Terry.May@rebel.ronly.org
Message-ID: <bfd_9708150033@ronly.org>
Source record: 118359

I'm currently using an SC1224 monitor on my Falcon and am looking to get a new monitor, for the increased size, clarity and picture stability.

I'm looking for something at least 15" with a minimum 1280x1024 noninterlaced resolution, no more than a .28mm dot pitch, and priced no more than about $300.

Any suggestions?

Surplus Direct is selling a 15" NEC MultiSync XV15+. It has a CromaClear CRT, a .25mm dot pitch, a maximum 1280x1024 resolution and lots of bells and whistles, for only $299.99. The only drawback is it's factory refurbished.

Also, using ScreenBlaster what's the maximum screen size I can expect to get in true color? I know I won't get the 768x480 I can get now, but would like to get something reasonably large.

Hi,

Are there anyone reading this newsgroup using a K56-Flex modem with an
Atari Falcon030? I would like to be certain there are no problems
before I go ahead and I purchase one of these.

Quick replies would be greatly appreciated!

Thank you,
Daniel

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. Everything mentioned on this list is on this list
because I have multiples of these Items and I thought I'd list them for
you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. And
Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore
CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives,
Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct
Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM
804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome
Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,
Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk
Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST
and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of
Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space
Eggs, Space Journey Math Educational Software, Target Practice, Temple
of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons &
Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the
Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The
Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World
Championship Karate. Productivity Software for the Classic Atari 8 Bit:
Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak,
Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc.
Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy

Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I

don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. >any copies?

There are a few registered Atari developpers that received TOS 4.92,
which is the last known beta of what would have been TOS 5.0 for the
Falcon 040 and possible subsequent machines.

Apparently, it incorporated a better AES and an upgraded MultiTOS.
This would have made it similar to what MagiC has become, though it
would have been built into the TOS roms themselves.

I do not recall it being available to the public. However, AES 4.1
(ie: MultiTOS 2.0) has been seen on a couple of FTP site's MiNT dir.

Well, not everyone can afford a new computer. You can not say that the
ST is a decent computer nowadays. Still most Atari computers around are
STs.

> Or you just buy a faster conputer. ;-)

The Falcon with 4 Bit Grafix (16 Colors) is not too slow. If that is not
enough add any acellerator Card - there is still 4 bit Grafix. The point
was just that a program should use the fixed standard palette if there
are only 16 colours available and in this special case CAB should give
the user the possibility to choose between Floyd-Steinberg and ordered
dithering, just as he has enough time, or as his Computer is fast enough
for him, and to choose between an optimized colormap if enough colors
are available, or a fixed one, according to his needs and his spare
time.

> that much biiger.

Not the single feature, but the mass of single features increase a program. Also modularized software is a lot more flexible. Why should the user load the code for may be STUCKY dithering (yes, there ar tonns of dithering algorithms around) if he never uses it? Why can he not load some modules on demand, like a module for dithering Printer output? I am shure that most users would only need half the RAM they use now if he only had the code he really uses loaded, and loads other code dynamically.

> > Another possibility to make almost all users happy is to use something

> I havn't heard about this.

OLGA is Object Linking For GEM Applications. ID4 is the inplace drawing extension to OLGA (Inplace Drawing for OLGA) the VIEW protokoll is a protokoll especially for programms using an external file viewer. I know that there are at least two viewers that support it (GEMVIEW and Look'n See). GEMVIEW is a good file viewer which lots of dithering options (I remember at lest 4 dithering algorithms and about as many color reduction algorithms, and you can choose how many colors of the existing pallete are changed. I hope this explains everything I mentioned. You did not say what it was you never hered about.

Looking at the rest of this thread you will see that some people have
downloaded succesfully. no problem, and unzipped no problem, this
would suggest that the zip file on site is perfect,

whats the difference between the people who get it ok and the people
that dont, I dunno :(

Sorry but now I know the zip file is OK and the site is a stable one,
unlike Geocities ect, then theres little more I can do, hmmm

Thinking about it... how about splitting the zip file, runner.prg
then say 4 zips equally holding 50-60 articles each, maybe that would
have more chance?, whaddayafink ?

A friend of mine has one-it was purchased from Rising Star computers, who
AFAIK, no longer support Atari... It was a PC drive in an external case,
adapted to work with Mega STe's and TT030's... :)

Hi Mark,
System solutions in the UK should be able to help - they have a board
which allows you to use IDE drives (and panther graphic cards as well
I think). It's all apart of the Pak 030 system, so you'll be in for
quick alot of nosh. Email them at ssolutions@cix.compulink.co.uk or
visit their www page at www.ssolutions.com
I hope this helps.

On some TTs you can replace the battery through the back of the area the
hard drive fits in. I was able to get a replacement from Radio Shack
for around $17. My battery was stuck to the metal frame with double
sided tape. It plugged into the motherboard and the replacement came
with the same plug. I purchased my TT when they first hit the market
so I have a very early system. Hope this helps.

If you contact B&C Computervisions in Santa Clara, California, they can
sell you the cable you need. Their web page is <www.myatari.com> and
you can find their phone number and address there.

2002. Battery for TT clock???

Newsgroup: comp.sys.atari.st
Date: 1997-08-16 00:00:00 UTC
From: John.Kormylo@7861.conchbbs.com
Message-ID: <d09_9708161106@conchbbs.com>
Source record: 118138

```
b > Can anyone tell me what batteries the TT uses for its clock,
b > and EXACTLY Where it is physically located?

The original equiptment is a 3.7 volt lithium battery in the form of
a retangular box with a velcro pad on one side and a cable attached.
You should find a replacement at any good computer store, as PCs use
the same type of battery.

In addition, one can replace the battery with other (cheaper)
batteries, including 4 AA batteries in a case. The clock is very
flexible regarding supply voltage.

The battery is located in the hard drive enclosure, which is opened
by loosening a single (flat) screw.

There are some previous newsposts about this, archived on my page.
Alternately, there are 9-pin to 15-pin VGA adapters on the market.
Making your own based on the wiring guide, on my "TT030 Homepage",
will probably cost less and give you the exact lenght you need.

From: dingdong@dingdong.com
Message-ID: <5t4nis$3qn$1@kirin.wwa.com>
Source record: 118140

hi. I found an Atari 520st with the 1meg upgrade and an Atari Monitor at the thrift store for $9.00. I also found a bunch of books, all way to technical for me. There was no mouse, no disk disk drive, and no power supply. On the back of the computer written in pen was "1 meg upgrade, TOS in ROM".

I have a KORG DX3 synthsizer, and I would love to do some MIDI with the 520st.But first I have to get this baby going!!! I have never used an st before, only 8-bit Ataris.

There is a "SIO to PC" cable which enables you to use a PC as a hard drive for the Atari 8bit computers, works great! Is there something like this for the st? Also, I have a bunch of Atari 8bit disk drives, could I connect these to the st?

Anyone interested in programming books for the st? I would be willing to trade them off for a little hardware and help. I did pay extra for these at the the thrift store. They are probobly pretty common, but they would be a great addition to any Atari st prgrammers out there. The books are in great shape too! Im hoping there is a st enthusiast out there with some extra stuff laying around, like maybye a power supply fot the 520st, a mouse, heck, maybye even a disk drive!

Here is the list of books I found.

1."Atari ST Peeks & Pokes"
Author:Stefan Dittrich
Publisher:Abacus

2. "ST Disk Drives:Inside and Out"
Author:Uwe Braun
Publisher:Abacus

3. "Atari ST Internals"
Authors:Klaus Gerits, Lothar Englisch, Rolf Bruckmann
Publisher:Abacus

4. "Atari St Machine Language"
Authors:Bernd Grohmann, Harald Slibar, Petra Seidler
Publisher: Abacus

5. "Compute!'s Technical Reference Guide Atari ST Volume One, VDI"
Author:Sheldon Leemon
Publisher:Compute!

6. "Compute!'s ST ARTIST"
Authors:Selby Bateman, Lee Noel, Jr.
Publisher:Compute!

7. "Introduction to Sound and Graphics on the Atari St"
Author:Tim Knight
Publisher:Compute!

Well there they are! 7 great books st books.

I would like to trade all these books to the same person.
Remember all i want in exchange is a power supply for the 520st, a mouse, and a friend to help me get the computer goin. If your feeling generous, throw in a disk drive. Maybye im asking to much, but im hoping that any there is an st programmer out there with a big ole hard drive who may not need that extra floppy drive.

Also, if there is a st perhiphrial emulator and cable I can build so I can use my PC's hard drive, or, if I can connect an Atari 8-bit disk drive, all the books go for just the power supply and mouse.

Im really excited about this 520st, I cant wait to see it goin!

my email is ericcron@wwa.com

THANKS!!!! :)

There is no reason to use the same kind of battery, a few months ago,
I had the same problem, and someone said that I could replace the
battery with two normal AA alcaline 1.5 volt ... so I did and until
now my TT clock works perfectly ... even better than before ... So you
don't have to pay too much money for a special kind battery ...
believe me.

Start using "STarCall".
It registers time and cost of every modem call.
You can display monthly amount and the amount for any other time period
also.
You can enter different prices for different time and distance zones.

I have extra power supplies for 520's, an external SS (360K) disk drive (and its power supply & cable). I also have a pair of DS (720K) drives suitable for a 520/1Meg. I have a box o'mice, one of which will no doubt work fairly well. I'll offer the power supplies and one SS drive if you cover shipping (the ps for the 520 is a solid heavy item). I'd have to charge $20 CDN for the DS drives, + shipping. I can throw in a few shareware MIDI programs & some other items you'l need for better ST computing.
Did you say you have a monitor?

The battery is a Tadiran TL-5242/W 3.6 volt high energy lithium. It's
located at the back of the computer and held in place with a velcro strip.
You can get to it thru the hard drive bay, one screw to loosen. BTW, the
Mega Ste uses the same battery.

> Ok. But I need to have this CPX module in the control panel, right?

No, not if you only use STinG the way I described above. Since CPXs consume
virtually no permanent memory I still suggest to install it.

> And mark the box for "modem1", or isn't this necessary either?

If you installed the CPX, dial-up a connection with the Dialer, and you'll
see the status of the 'Active' box in the CPX has changed accordingly. So the
CPX is not essential.

> I've noticed that in order to disable STiNG (i.e. if I want to use my
> normal VT-100 connection using "Connect") I have to switch off the "active"
> button in the "STiNG internals" CPX as well as the "active" box for

> terminal emulation software. Having "modem1" marked off as "active" seems
> to block the modem port for use with STiNG.

You should be able to 'get through' with your terminal emulator as soon as
the 'Active' box in the 'Port Setup' is disabled. The Dialer should do this
for you if you click the 'Disconnect' button, so again here the CPX is not
essential.

The 'Active' in the 'Internals' is to switch off STinG completely. This has
already proven to be useful. STinG always steals a tiny amount of CPU time
for doing it's job. Some (bad) Zmodem implementations cannot cope with the
situation that another program uses the CPU this way, and thus give CRC errors.

So only if you want to use one of those Zmodems you need to touch the 'Active'
in the 'Internals' CPX.

CoNnect definitely only needs the 'Active' in the 'Port Setup' to be switched
off, as it is done be the Dialer. CoNnect 95 has a bug that lets it produce
a rather irritating error message ('Please update your HSMODEM' or similar)
instead of the proper one saying that the interface simply is in use by
another program (STinG for instance).

>>Go through the DIAL.SCR, it contains plenty of hints on what to do which each

> wasting phone money only on experimenting with STiNG.

You should be able to start it up this way, although the Dialer is there to
save you from all this hassle. So doing this, you won't need the Dialer, but
the 'Port Setup' CPX. Make sure you got a) your IP address (very important),
b) the MTU your ISP is using (use 572 if unknown), c) whether that 'TIA'
does true uncompressed SLIP, or Van Jacobson Compression is used (ask your
ISP if in doubt). Then, after establishing the connection with CoNnect, leave
CoNnect, open the 'Port Setup' CPX, choose the port your modem is connected
to, and enter IP address, MTU, and set to SLIP, click Jan Jacobson Compression
if needed (TIA emulates CSLIP). Then click 'Active', and 'Ok'. If you've put
the proper port into your routing table (ROUTE.TAB, read it for hints), then
you should be able to launch CAB, and surf the web.

>>The bit on the routing table is important, as this feature is still missing
>>in the Dialer. STinG has to know where to deliver the data. So you need to
>>supply a line of text in ROUTE.TAB. Use an editor that distinguishes TABs and
>>SPACEs, as they got different meanings in this file. STeno is a bad choice !
>>The file contains four entries, separated by one or more TABs (!) each. For
>>just having a single connection across a phone line, put 0.0.0.0 as the first,
>>second, and forth entry. The third entry is the port name your modem is connec-
>>ted to (the same port name you told the Dialer to use). On a Falcon you'd put
>>"Modem 2" here (without quotes). Note in front of the "2" is a SPACE !
>
> I'm a bit confused about this part. maybe this is the reason I can't get a
> connection.

> But according to what you say I should keep it like this:
>
> 0.0.0.00.0.0.0Modem 10.0.0.0

I'm not sure what happened to this line, the TABs seem to be erased. If in your original version the TABs are still there (like in the distribution), then this line denotes A proper default route. It is THE proper default route only if you indeed have your modem connected to the 'Modem 1' port. I don't know what type of machine you're using, on a Falcon you pretty definitely do not use Modem 1 ! Replace the 'Modem 1' bit by the port you use.

> What about my provider's IP addresses? Shouldn't I enter this here?

No. Currently it's not needed by STinG.

2014. Looking for parts (Disk drive)

Newsgroup: comp.sys.atari.st
Date: 1997-08-16 00:00:00 UTC
From: Austin Skyles <askyles@execu.net>
Message-ID: <5t5h1i$602@infonow.execu.net>
Source record: 118150
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I pulled out my old Atari ST recently after storing it away for years . . .
the disk drive was bad before I retired it, I managed to get it cleaned up
and able to read single sided disks, unfortunately single sided disks ONLY.
I need a new/used working internal disk drive if anyone knows of a computer
store that may have some parts lying around . . . it seems Atari ST stuff is
kind of hard to come by these days.

Austin Skyles

2015. TT and 195 question

Newsgroup: comp.sys.atari.st
Date: 1997-08-16 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5t3hoh$454@alexander.INS.CWRU.Edu>
Source record: 118151

I am looking at a used 195 19" monitor for a TT. The FM says "Consult
the manual supplied with the monitor for further instructions" and
there is no manual with the monitor!
IIRC, the monitor has a 9 pin connector and the TT monitor out
has a 15 pin. Do I just use a 15-9 pin adapter and plug it into the same
outlet on the TT? Or what?

Yes, it's possible to attach an IDE drive to the ST, but not without some
additional hardware. Please take a look at Titan Designs homepage, they
have what you're searching for!

>___ Blue Wave/386 v2.30

Hi Bo,

Well, there are probably a lot of Atari users in the Seattle area, but most use PC's if they are on the Net. Butler's is still alive, but they won't touch an Atari ;(Too bad. They did a good job of supporting Atari, but are strickly PC now.

I've been a member of SPACE for many years. We still exist, but have been whittled down to a dirty dozen or so. We meet once a month in a Tacoma Library. Most, except me, use PC emulators, thanks to Darek... Anyway, life goes on.

C'est la Vie,

Charles

P.S. If any Seattlites/Tacomaians are interest in SPACE, e-mail me.

2021. VFAT on MiNT? External HD floppy?

Newsgroup: comp.sys.atari.st
Date: 1997-08-16 00:00:00 UTC
From: q-funk@citenet.net
Message-ID: <5t2tsmakc1@cti01.citenet.net>
Source record: 118372

1) Has anyone ever come up with a VFAT.XFS for MiNT?

I often get pictures and logos from customers on Zip/Jaz/floppies formatted using VFAT under Win95 and need to read/write longnames using VFAT. I *know* Minix is a much better filesystem, but there is a need for compatibility I cannot avoid. Sources to Linux VFAT exist at the following address and could be ported to MiNT:

http://www-plateau.cs.berkeley.edu/people/chaffee/vfat.html

Any volunteers to port the sources to MiNT?

Note: I am aware that MagiC 5.13 has VFAT, but I prefer MiNT.

2) Was there ever an Atari external HD floppy drive?

I am aware of SF314 DSDD and SF354 SSDD, but was there any DSHD?

Please Cc your reply through e-mail also, in case I somehow miss the one from the newsgroup. Thanks!

s> Can anyone shed light on these problems, please?

Try me!.

s> 1) In MagiC's desk, why do the partition icons gradually migrate to the
s> right and eventually tramp all over themselves, nearly off-screen?

Er!, ergh!, that dont happen here, maybe you could experiment with the icon distance/raster setting.

s> 2) Is it possible, as under TOS (TT) itself, to open partitions without
s> their icons being present on the desk? I have tried without them, but
s> Magic doesn't recognise the partitions without them. Its a nuisance,
s> for they do take up precious memory.

Nope, you have to ALT - L to log the drives before you open them, or as an alterantive you could just have the drive U icon on the desktop and open drives via that.

It is a black oblong box 60x15x18mm stuck to the back of the TT with
velco. Two wires go to a 4 pin connector on the TT motherboard.
A 3.6v high energy lithium Nominal capacity 1.9 Ah battery manufactured
by TADIRAN.

There was an multi-purpose board that was supposed to give it an IDE
interface, but IMHO, you'd be better off going with an adaptor like
the Link, and a SCSI drive... :)

>While I'm at it, what steps would be required to put my STE or STM

Since Atari monitors are non-standard it doesn't hurt to pick up a spare.
Certainly not at those prices. But..... my SM124 has lasted
10 and a half years. I recently bought a SC1224 that is even older. It's
the JVC model. And it works fine as well.
Thrift stores are good for picking up other computer stuff as well. I got
an Epson FX-80 and an FX-80+ for a total of $25 two months ago.

Actually you've got the right idea about the Atari getting too hot. Is the fan still working?
Did you install any hardware upgrades? It seems that most everytime I used to read about addons, the article never failed to mention that Atari power supplies are barely adiquate for stock Atari computers. Although the MSTE's power supplies are designed to handle extra memory and a hard drive unlike the old 520/1040 ST's. But nothing last forever.
About 10 years ago my mother's PC had the same problems as your MSTE. It would run for awhile then quit. In her case, the problem was a weak power supply that would die once the computer got fully warmed up.

2034. SCSI termination Q.

Newsgroup: comp.sys.atari.st
Date: 1997-08-17 00:00:00 UTC
From: guitarmn@earth.execpc.com
Message-ID: <5t69up$755$1@earth.execpc.com>
Source record: 118160

Hi, guys, in my NEC 4x cdrom drive manual, it says to terminate both the first and last items in the chain. I always thought just the last. Was I wrong? Thanks in advance.

2037. Eagle Sonic Accelerator for Falcon

Newsgroup: comp.sys.atari.st
Date: 1997-08-17 00:00:00 UTC
From: Austin Walshe <ajwalshe@deakin.edu.au>
Message-ID: <33F6B556.433E@deakin.edu.au>
Source record: 118163

Hi All,
I am curious to the reliability of this board and is the small amout of overall system acceleration worthwhile? I know of one Falcon which died after a couple of years with the CPU running at 32 MHz.

Thanks
Austin Walshe

Hoi,

Try the Belgian ftp site 193.190.205.13
archive/atari/editors-word_processors

It contains AFAIK the latest Ghostscript release

Hope this help

Yo-da ynoT!

Well, I just tried Geocities again and this time I got (better than Netscape)
about 527k before the server burped. "Why Not" get your mates to reload
this sucker :) Still no problem with your site. Maybe some have a problem
with large files with CAB. I thought I could get the file using the URL
feature with NEWSie, but NO way. The Dialog box of NEWSie only allows about
65 characters and you need ~70 to get the exact (binary) URL file ;)
Maybe John can expand this feature as URL's are getting bigger by the day :)

I'm using CABv1.5/OVLv1.2618. I don't think splitting the zip file is needed.
Thanks again for the tip to use F1, F2, F3. BTW, who was the model for the
"Tiny Dancer"? She sure knows how to shake her booties!!!

I know this may sound like "heresy", but is there any chance to get ST+ in
a HTML format for us CAB fanatics? I know this would be a LOT of extra work,
but would be a quicker read for browsers :) I created a special Auto folder
just to run ST+ on my Falcon, so I'm not complaining... Just a whaddyafink?

Ta da,

Charles

P.S. This is the 4th attempt to post. Sorry to break the thread ;(

2045. Fast_Serial vs. HSModa07

Newsgroup: comp.sys.atari.st
Date: 1997-08-17 00:00:00 UTC
From: csilver@kendaco.telebyte.NoSpam.com
Message-ID: <5t6k2jinr1@brokaw.wa.com>
Source record: 118171

Hi Kemosabes,

Well, soon I'm going to connect at 56k on the Net. But I have a problem.
I much prefer Fast_Serial to HSModa07. Why? I've recently been using
HSM07 at a connection of 115.2/57.6k baud (only a 28.8k modem) and have had
some disconnects/hangs that I don't have using FS at 57.6k. Unfortunately,
FS doesn't support Modem 2 (Falcon) at 115.2k, only Serial 2 (TT).

I can see now why a lot of people complain about CAB/NEWSie connections
on the Net. It could be their server or maybe HSM07.(Just a remote chance)

If I get a 56K modem, Roger Cain said a minimum of 115.2k was needed, and
what he said makes sense. FS supports 153.6k (Falcon Modem 2), but the 56k
modems don't ;(

I think you can see my problem. Does anyone know if there has been an
update to Fast_Serial? Franz Sirl's prg is excellent, but was written in
1993. The CPX was written by Roman Hodek. It's on several ftp sites as
fser096b.

If anyone knows these gentlemen or knows of any updates, please let me
know. I sure would like to connect at 115.2/230.4k baud on my Falcon with
Fast_Serial. Any suggestions?

Regards,

Charles

There's certainly a ZX81 emulator. It even went so far as to emulate the keyboard. I also have/had a couple of BBC and Apple II emulators. Email me if you want copies and I'll do my best to see if I've still got them. I can't promise I have, and I sure aint spending hours searching unless you do! :-)

Some software, mostly games, had an annoying habit of leaving the floppy
drive motor spinning constantly. Depending on the operating system
version, if you removed the floppy at the wrong time it would not stop
the motor either iirc. It's nothing to worry about, except it is
annoying!

> 3. The third thing may be new, I just can`t remember if it was

Then it was probably one of the accessories or perhaps a combination of
them and the operating system version.

> Does anybody know if I have to be worried?
>

Nothing to worry about.

For instance, if I access my 2nd external floppy drive and click "abort"
when it has no disk in it the drive stops working until I turn it off
and on again. If I put a disk in and click "retry" it carries on working
just fine. It's always done this from TOS 1.2, then TOS 1.4 and still

does it with MagiC. Gives the machine character! :-)

> RAM for my programs? Drag and drop just brings up the command line...

syntax:

limitmem [executable program] [kilobytes assigned]

So if you double click on limitmem just type the *full* path to the executable then a space then the number of Kb it can have to use such as D:\APPS\MYPROG.PRG 1024 which would limit myprog to 1Mb of memory.

Versions later then magic2 iirc, have a different method under install application I think. You'll still have to use limitmem if you use a replacement desktop however.

Nearly forgot, to undo it use a hypen [-] instead of [kilobytes assigned]. You don't have to undo before setting a new value.

: The Falcon with 4 Bit Grafix (16 Colors) is not too slow. If that is not
: enough add any acellerator Card - there is still 4 bit Grafix. The point
: was just that a program should use the fixed standard palette if there
: are only 16 colours available and in this special case CAB should give
: the user the possibility to choose between Floyd-Steinberg and ordered
: dithering, just as he has enough time, or as his Computer is fast enough
: for him, and to choose between an optimized colormap if enough colors
: are available, or a fixed one, according to his needs and his spare
: time.

My experience with the Falcon, at least where runnin CAB, or graphics viewing applications, is that the higher color setting I use, the faster browsing is! I.E. If it run it in true color, it displays jpeg much faster because it isn't having to spend much time dithering! I do use a DSP jpeg overlay...so I'm sure that helps alot as well!

I usually run CAB in 256 color mode, and find that it displays complete pages much more quickly than 16 color modes (at least those with several graphics). Same applies to viewing pictures with Image View 4.0! The true color mode works fastest, where lower modes require the picture to processed at least once, sometimes twice, and that doesn't include unpacking it! Here's where I draw that conclusion...

If I open a GIF file to view using ImageCopy in 16 color mode, I get a dialog that counts down the percentage of the file as it is loaded and unpacked, then I get a second dialog that does the same thing as it dithers the GIF, and finally, it pops up on the screen. If I view that same GIF in 256 mode, I only get the first dialogue, and it pops it right up on screen...hence, it takes me twice as long a wait to see the picture in 16 color mode as it does in 256 color!

Something I often wonder, is if the DSP can be used to unpack GIF files as well. This way, the 68030 could keep formatting tables and stuff, at the same time DSP is doing graphics work. Is that possible?

Brian

2056. Help me !!!! ST monochrome !!!!

I just got a monochrome monitor and absolutely love the resolution. I feel like I am out of prison after using a tv for text !!!

There used to be a program to emulate a color monitor on a monochrome. I don't remember the name or if it was commercial or PD software. Anyone know where I can get it ????

2057. Help! Unknown TT graphics board?

Newsgroup: comp.sys.atari.st
Date: 1997-08-17 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5t7s13$o05@alexander.INS.CWRU.Edu>
Source record: 118233

Can anyone help? I just bought a TT in a tower case, that has
16/10 Meg and a graphics board of some type, that I can't recognize.
It is two boards piggybacked at right angle to each other, i.e
one board has the VME socket and the VGA out connector on it and a second
board, about 50% larger, is on top rotated so the boards are parallel, but
the long axis is perpendicular to the long axis of the other. They are
joined by a multi-pin set of standoffs with some other stuff in between.
There are also two standoff pins to give physical support. The top board
has a ribbon connector, that goes to a socket on the back panel labeled
Satzbelichter. I read where the Nova wont work if the board has 16/10 memory,
so it doesn't sound like a Nova. The only identifier I could find was on
a teensy piggyback board with one chip, labeled "matrix". It was originally
used with a ttm195 19" monitor, I presume to get a greyscale screen
for photo work. If I can, I want to use it for 256 color (or higher)
with a NCR 17" SVGA.
Does anyone recognize it from this description? If so I haven't
been able to get it to work at all, since I can't identify the driver,
and how to init it. Do you know the name of it's proggie?

Well, there ARE in my MagiC package. You run LIMITMEM as a TTP and as
a command line you give:

<full path spec of program file> <max 1K RAM blocks to be allocated>

i.e.

limitmem c:\worplus\wordplus.prg 512

It will amend the load block of the program so that MagiC will load it
to a limited RAM segment,

Sounds like some chips may have come loose in their sockets. Open the
beast and push home all socketed chips.

>The other Problem has to do with my mouse....It likes to wonder by
>itself...I have gone through 2 mouses because I thought it was a chip
>problem..The second one worked fine for a few days...Is there a way I
>can fix this...I think this has to do with the ST and not the mouse
>itself.

This can often happen when the mouse socket has been disturbed by
frequent connection/disconnection. Open the beast and examine the
soldering of the mouse socket to the PCB. CAREFULLY renew all soldered
joints.

.. OR you may have dirty mouse rollers. Remove rubber ball - clean
rollers with matchstick followed by cotton bud and solvent.

You're of course right here. The LAN port of those machine is in fact nothing
but another serial port, with some 'unusual' charcteristics, as output voltages
etc.

I don't know what you want to do, but you might want to try out STinG, to be
found on my homepage (see sig). It LANs machines using their serial ports, it
can be any from Modem 1, Modem 2, Serial 1, Serial 2, LAN, Midi; or even self
built ones (!) if supported properly with a RSVF driver.

What is really plain stupid is that very reply !!!

Nobody apart from that guy himself can say if the 40 MB drive is useful
or not, it depends solely on his own purposes. Sure it's not the most
modern, but that is not at all a reason to toss it.

The last part is even more stupid ! Why throw the Atari out, if it still
fits his purposes well ? And most stupid is that silly, unreflected
comparison of clock frequencies. Only newbies that have no clue at all
on the matter compare two completely different CPU architectures this
way.

> FTP'ing a text file that can get 4:1 compression. If you are uploading, then

This is not possible. The TCP/IP headers for the FTP connection seriously
hamper the modem's compression efficiency, so you'll never get even close
to a 4:1 compression ratio. The point is valid however for headerless proto-
cols, like Zmodem.

Just saying that if you only do Internet connections with your modem, you
won't loose much if your machine to modem speed is only twice the phone line
speed.

For compressing Internet traffic more efficiently, special compression
algorithms must be employed, none of which are currently implemented into
any modems.

The following items are up for sale. Please email offers.
All software is original disks and includes original docs.
There is some other stuff... a PC Ditto board w/soldered
68000 cpu, Spectre GCR w/roms, Migraph Touchup w/scanner
(the power supply for the scanner is missing so it is not
tested yet, if anyone knows the specs on the ps, I'd
appreciate the info), IMG scanner, a whole suite of the
Cyber software, etc. As soon as I can get to it and test
these, I'll post them. Everything is "make an offer". I'd
be interested in trades for a hard drive (nothing elaborate,
a 20-80 meg supra or ICD or whatever setup would be fine.)
I'd also be interested in trades for midi sw/hw or a set of
TOS 1.4 roms (although I haven't even checked to see if I
need 2 or 6 chip sets.)

Ed
Balt. MD

edncori@charm.net

PS: for those who helped me out w/midi sw... if you see
anything that would be useful, let me know.

2074. Re: Scanning .acc?

Newsgroup: comp.sys.atari.st
Date: 1997-08-17 00:00:00 UTC
From: greg_evans@delphi.com
Message-ID: <5jKdHwz.greg_evans@delphi.com>
Source record: 118250

Well, it depends on the Atari and the scanner. If you have an ST, STe or TT you can use the Migraph or Golden Image hand scanners with a program called ScanLite. It only saves in IMG however, since these are b&w scanners. For color work you can try the Mustek Paragon flatbed scanner drivers which can save in TIFF. Perhaps GT-Look which runs with Epson scanners can be used as an ACC. Homa Systems sells a Microtek flatbed scanner driver but I don't know if that works only as a program.

Hello,

I have mounted a SyJet 1.5gig into an unmodified TT... However, there
isnt a way to
lock the cartridge into the drive, and possibly could be ejected, damaging
the cart and/or
mechanism. Any ideas,programs that would lock/unlock a drive...

Alex!

I fully agree with all! NOTATOR SL not< v3.0 is really good
solution and perhaps a single right (this my personal pint of
view!). I using NOTATOR SL started from 1991 and up to this
times (exept, of course, the LOGIC) I can't to see most power,
user-friendly and easy-to-use professional sequencing software.
And not only for the ST!
Highly recommended too. AFAIK, suggested retail prise of legal
version in the Germany is ~300DM (hardware coping protection key,
4 FDs and all DOCs are included into this pakage). Street price
(e.g. from German's "Keyboard instruments" approximately $200-250.
This program best of all using with hardware options such as
ExPort (multiple MIDIx3 out port), UNITOR II (SMPTE reader/generator
and multi-functional synch device) and much more.

Don't know if it will help, but I have here in front of me the Consumer Manual
for the Philips monitor range CM88**.

The spec. for euroconnector is like this:
Pin
1 -
2 audio input
3 -
4 earth connection to audio
5 earth connection B input
6 audio input 0.5 Vrms /> 10 kohms
7 B input 0.7 Vpp/75 ohms
8 -
9 earth connection G input
10 -
11 G-input 0.7 Vpp/75 ohms
12 -
13 earth connection R input
14 -
15 R input 0.7 Vpp/75 ohms
16 fast blanking
17 earth connection CVBS

18 fast blanking earth
19 -
20 CVBS input 1 Vpp/75 ohms
21 screening plug

*NOTE: Pin 20 is also used for the synchronisation signal of a
linear RGB input.

The TTL RGB DIN spec.

pin 1 open
pin 2 red
pin 3 green
pin 4 blue
pin 5 intensity
pin 6 earth
pin 7 H.synchronisation or composite synchronisation
pin 8 V. synchronisation

That's all I can tell for now. Hope it'll help a little.

cheers

That's right, StarCall can also be set up as a answering machine and log
incomming phonecall's.

It work's with zyxel and creatix modem, AFAIR.

HA>I'm looking for a program which logs phone calls, i.e. registers the time
HA>of when the phone rings (via the modem ofcourse).
HA>I already have "calltime.prg", but it's a bit "clumsy" as it won't allow
HA>you to run any other stuff alongside it.

I made one like that; it logs when the phone rings (time & date) and how
many calls were made.
Phoney (that's how I called it) recognises incoming fax and data calls
and starts a program that can receive faxes.
At the moment it's only a TOS-interface (no GEM), but I started redesign
to a GEM interface.

Problem is: I'm afraid my Falcon died :-(

I'll let you know when I solved that (BIG) problem... (If I ever will be
able to solve it :-( )

> into the command line. Do I type the directory etc? How do I allocate
> RAM for my programs? Drag and drop just brings up the command line...

syntax:

limitmem [executable program] [kilobytes assigned]

So if you double click on limitmem just type the *full* path to the executable then a space then the number of Kb it can have to use such as D:\APPS\MYPROG.PRG 1024 which would limit myprog to 1Mb of memory.

Versions later then magic2 iirc, have a different method under install application I think. You'll still have to use limitmem if you use a replacement desktop however.

Nearly forgot, to undo it use a hypen [-] instead of [kilobytes assigned]. You don't have to undo before setting a new value.

>Progressive Metal Guitar For The '90's

Hi Cory! Usually, your host adaptor does the termination at the start of
the chain... For example when I plug a SCSI CD-ROM and EZ-135 into my Falcon,
only the EZ on the end is terminated, the CD does not have to be...its done
in the Falcon. Same thing if you are using an ST with a Host adaptor like
the Link. Hope this helps! :)

Hello you Atari programmers !

Does any of you fancy typing a good editor/librarian for the Yamaha XG instruments ?
That would be a *good* idea, makin'me feel warm inside, 'coz I was a bit upset when I saw the gorgeous prog the Mac users can use (a shareware prog that is presented on the Yamaha WEB site).
And if it was Cubase compatible ? Wow ! That would be Tahiti in the middle of Groenland.

From: rgronoff@imaginet.fr
Message-ID: <5tadib$aao@belzebul.imaginet.fr>
Source record: 118184

Hi Walter,
I also use an EZ 230 drive, and I've never experienced this kind of problem. To answer you, I need to ask you a question:

You wrote your HD's are ACSI, meaning you are using a ST computer. But the EZ230 comes mounted with 25 pins SCSI plugs that won't fit either the ST nor the other ACSI drive you have !
So, how did you connect the SyQuest ?

Then, I know of a little problem that occured to me in the beginning: if I turned the drive up WITH a cartridge in, the bootsector was sometimes damaged (I think there's a check at boot-up that tries to "correct" the bootsector if the drive doesn't recognize it... and it doesn't recognize any Atari format, of course).
So, try turning your drive on just before inserting your cartridge.

I use the ICDpro driver, and it could be another reason: maybe there is an incompatibility probleme between HDdriver and the EZ230...

Bye.

Yeah, one of those underscores -------------^ should be a dash.

: Or is there some other public spirited person who has successfully
: downloaded these files, who could compress them using STZIP and upload
: them to a site or two? A faint hope, I'm sure, since the files are so
: large.

OK, I downloaded the original .zoo files off the U Texas site, but can't
check their integrity right now (don't have a zoo tool on this machine).
I've also snagged a copy of .zip file on Martin's site, but it isn't the
file you need. He has a copy of the binaries that you need, but they are
also .zoo compressed, so I figured the one's from the Texas site would do
just as well.

Now, you can download the .zoo file of my machine at ftp:128.120.234.42/atari
I put the file in the Utilities folder. You can get to the same place
using http://128.120.234.42/ftp/atari/Utilities/

>--
>Howard Chu

Howdy Howard,

Well, when I look 180 degrees to my left I see a 1200/14.4k/28.8k baud modems.
Did I waste my money? I bought some fancy Cowboy Boots for $350 a few years
back that I only wear 3/4 times a year ;) That was a waste of money :)

Thanks for the info though, but I'm sure I'll get more use of a faster modem
on the Net. Even if I only get 44k downloads, it would be better than the
21k (avg) that I get now. Of course cable modems are on the way here, so that
blows everything away. Falcon compatible? I don't think so. BTW, most people
that know me would not refer to me as tolerant. One on my faults <g>.

Regards,

Charles

Hallo Peter,

The bottom line is that this modem will be used 95% of the time on the Net
with TCP/IP. Any improvement would be appreciated. As my mama use to say
"The PROOF is in the pudd'in, recipes are just THEORIES". Hard lesson to
learn as the computer biz is full of vaporware/junk etc. Micro$lop is
PROOF of that ;(Expensive "foul tasting" pudd'in to say the least.

Of course taste is "hard to quantify". Hopefully, Intel/MS won't impose
their taste on the Net as they have "everywhere else"...

>
> Er!, ergh!, that dont happen here, maybe you could experiment with the icon
> distance/raster setting.

When you're double clicking on the drive icons Magicdesk thinks you're
wanting to move them first. Since most hard drive icons are located on
the right you click on them as you "arrive" from the left, this will
cause the drives to move off the screen slowly with the movement of the
mouse.

There is no solution other than reloading MAGIC.INF or not moving the
mouse when double clicking on the icons (or is there an anchor code in
magic.inf ?)

No, you are right! It is just the LAST device which needs to be
terminated.

I think there is a bit of confusion in the documentation. The first
item in the chain is, in fact, the driver for the scsi bus which will have been
built to have the correct impedance anyway. Termination at any later
point in the chain will behave like a piece of scsi-blotting-paper.
The only place you want this is at the end where a terminator will
avoid signal reflections.

CS> nem_hi.prg
CS> hrtc.prg
CS> drvin.prg (or fastserial)
CS> scc.prg
CS> mintnm.prg (mint v1.14 notice nm)[LAST]

I use the same config with pppkit to be able to "ppp connect" on the web,
but my auto folder is ordered in a different way:

stoop
flop_fix
tos4trap
folder300
extendos
nvdi
ckbd
fast_ser
mintnm
sb_auto
jpegd
ledpanel
wdialog

Note that mint is not at the end but it works fine here.

GH> application I think. You'll still have to use limitmem if you use a
GH> replacement desktop however.

Yeah, you can limit memory from the Install Application dialog, but that only works when running the application direct from Magxdesk. If you run another program from Magxdesk and then that program loads your application, the memory limit you assigned with Install Application doesn't work. So you still need LIMITMEM.TTP.

Hi Charles,

I can give you the solution I've been using for awhile now: replace
Magicdesk by Thing 1.09. It's a *great* shareware desktop you can
download from any good ftp server (try out ftp.lip6.fr/pub/atari), and
you'll never use Magicdesk again (though it's a nice, small proggy
that doesn't eat all your memory, this said).

> know where I can get it ????

I know one program I think is called Big Color, it was on a ST Format disk. Try looking in the FTP sites under "emulators" or simular.

If you still want to play games, then you might as well keep your TV attached to the ST anyways as emulators aren't always good for them(see bottom for unusual exception)

The trick is you get a monitor switchbox and only plug the high-rez monitor in it. When you select the empty spot where the color monitor is suppose to go, the ST won't pick up the monochrome detect signal on boot up and you can use your TV. (But if you would happen to be able to pick up a RGB monitor then I suggest you do because the picture completely destroys the one TV's produce :)

[On a somewhat related topic for the rest of the newsgroup...the best way to play monochrome games on a color monitor is Sebra. It works with nearly all the high-rez games you can download. The only ones that don't work are the games that can be played on color setups anyways. And it's ok for occasional art work...very strange for a mono emulator to work so brilliantly like that.]

Note that if you have a TT the internal drive is the last, not the TT
itself. So in case you have an internal and an external drive connected
to your TT you have to remove the internal terminators of your TT,
located on the mainboard near the SCSI port.

This behaviour is typical of an intermittent in the memory circuits.

Check all socketed chips (including SIMMs).

Check decoupling capacitors on the +5v line for RAM.

Sure, if any solder joint looks dull, then re-make it.

You're looking for a replacement drive mechanism. A PC1.44 drive will do fine, as long as you can change the drive ID on it (which is a disappearing feature on modern drives). There's a file about doing such a mod in the Quick FAQ at:

http://www.geocities.com/MotorCity/2090/quickfaq.html

This sounds like an intermittent fault in the store system.

STs are prone to their socketed chips coming loose over time.

A common "remedy" is to drop the keyboard onto the desk from a couple
of inches.

Far better if you remove the 6 screws on the underside, then the
shielding to expose the PCB. Push home all socketed chips firmly. You
should find the problem goes away for a few years!

: >I'm looking for the "zmodem.zzp" file which update it to version 1.01,
: >anyone got it or know where I can find it?

: I actually found it myself at Umich in the "Telecomms" directory and it
: came as a separate "zmodem update" file for STorm.
: Tried getting online with STorm, but Zmodem still didn't work (I remember I
: had this problem a long time ago when I started out on the net..)

: Has anyone else used STorm and been able to use the "Zmodem" method of
: transferring files?
: Or perhaps I should just ditch this program in the bin....
: I just wanted to keep it on a disk for sentimental reasons ;-)

I still use STorm. To download I use Y-Modem G which seems very similar
to Z-Modem. There is some small problem that the download does not finish
properly, I need to hit ABORT after the transfer is complete. It
downloads fine but it doesn't know when to end the transfer. I think
Z-Modem works when uploading.

Hi, if you just need to monitoring the phone while you away, I think
you need the program by Lonny Pursell, it's called TELE_MON.PRG.
Don't know where to get it, but as I remember, it will do just what yor
describe, log time and date for incomming call and write it to a lofile.

From: Frank Lockwood <lockwood@freenet.calgary.ab.ca>
Message-ID: <5ta5hm$e38@ds2.acs.ucalgary.ca>
Source record: 118281

Well, thanks to all who have responded, but so far, no luck.

Martin Byttebier suggested
ftp://193.190.205.13/archive/atari/editors_word_processors/

Well, this results in a great big 404 error (not found), so I backed up to
the root URL, and got the Royal Military College's pages, which show no
links to any archive anywhere - so that's out.

Then Hallvard Tangeraas suggested
> Tim
> Gallivan's 'Ghostscript' page
>
> <A href="ftp://lifshitz.ph.utexas.edu/pub/atari/ghostscript/3.53/gs353b.zoo">
> Ghostscript 3.53</A> (585 Kbytes) [Postscript interpreter- for viewing/
> printing Postscript files on Atari ST computers]
>
> <LI>Ghostscript
> standard fonts -version 4.03 (1142 Kbytes) [Needed]
>
> <LI>Ghostscript
> other fonts -version 4.03 (1052 Kbytes) [optional]

Well, I tried once again and downloaded all 812361 bytes of the 3.53
archive. When I try to decompress using 2 In 1 and ZOO21.TTP it bombs
out. Decompressing with the ZOO shell and ZOO21.TTP or ZOO214.TTP it
starts to decompress, so I guess the transfer was alright, but I get
messages showing that the first two files in the archive are skipped, then
a WARNING: Assertion Error, and then FATAL: Invalid or Corrupted Archive.

Very anti-climatic. Jeez, all I want is to be able to view/print Adobe
Acrobat files...

Hallvard went on to add:

> Yes, it's a pain when people use compression formats which aren't
> recognized by web browsers etc.

It's the UTEXAS site which is not setup to treat .zoo archives as anything
but text/ascii.

> I suggest you try using an FTP program instead of a web browser to download
> the Ghostscript stuff.

Ay, there's the rub. I'm using CoNnect and a shell/text connection, since
all local ISPs in this city offer PPP only (Hallvard, I'm sure you can
relate), and only the freenet offers shell/text. I'm actually using

the freenet's online installation of Lynx to effect the transfer - most times this works flawlessly.

So, I guess the bottom line is a plea to Tim Gallivan to rearchive version 3.53 of Ghostscript, and maybe upload it to a few more FTP sites than just UTEXAS. UMICH springs to mind...

Or is there some other public spirited person who has successfully downloaded these files, who could compress them using STZIP and upload them to a site or two? A faint hope, I'm sure, since the files are so large.

Oh, and before some other kind soul tries to email the files to me - another limitation of using the freenet in Calgary is that I only have a meg of online storage for files, mail, everything - and by the time I've got my webpage on there, the largest files I can receive by email, save to my home directory and download are around 600 K - not enough for the gs353 archive. Enough to make you tear large hanks of hair out, isn't it.

>Has anyone recently tried this?

The most popular Atari enhancement is an HD - LOADS of people have
done it.

>Are Host adapters still available? s

Link 96 is a recent product. You can usually find ICD, Supra
second-hand as these are no longer required by people upgrading to TT
or Falcon.

>this the next weak link in my hardware chain (i.e. will these go out of
>production)

Just buy the next one you see!

Are there limits to the Drive size a megaST will handle? Can
>they be in GigBytes?

No practical limits (although there are on partition size). Yep - Gb
is fine.

Can I chain SCSI devices (would I need multiple Host
>adapters)?

One host adapter will support 8 SCSI devices (unless it's an AdSCSI+
where ID 6 is reserved for the real-time clock).

Could a SCSI ZIP or JAZ drive be used in a SCSI chain (assuming HD
>has to be device#1)

No need for HD to be device 1 although it's usual for the boot device
to be set ID=0. ZIP are fine.

Has anybody had great (easy) success with specific
>drives?

There are no real problems with ANY drive. Seagates are cheap and
behave well with Atari. Some people say they wear out faster than
others but I haven't noticed this. If you get a host adapter which
cannot handle parity (some Supra) you must make sure any device you buy is capable
of having parity disabled.

Don't worry, Greg, there's always advice available here from many
people who have been successful.

Hi Charles

I am using Fast_Serial with the english cpx on the TT with magic 5.1x
works great I have stoped using HSmodem. The program will log all the
ports at boot and set all the buffers and max speed for you. Just
select which port and speed you want with the cpx and of you go. It
works on my friends falcon. I am usig seial 2 at 115.2 with a 28.8
netcom modem flies along quite well.

Omnires was one such program. Commercial, if I remember correctly.

2137. Problems with TT030 computer

Newsgroup: comp.sys.atari.st
Date: 1997-08-19 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <97231.182245STIRRE31@MAINE.MAINE.EDU>
Source record: 118039

Recently I traded my Performa 6214 for a TT and the machine is
great but I have some questions that I have been unable
to find the answer to. First, I have problems running
many graphics programs. The TT has a Nova running at
640 x 480 x 256 (about the only resolution I can get right
now. True Paint, for instance has trouble loading
certain file types when using the Nova and Magic. It refuses
to load animations and JPEGs have colors garbled. Does
this stem from the card or the multitasking or the program?
It runs fine in TT rezes under singletasking.
Imagecopy 3 loads pictures fine but messes up the desktop
colors to make menus unreadable forcing me to reboot.
I have tried many different settings but with no luck.
Finally, I cannot get NVDI 4 to be happy with
this system. I have tried loading it in many
different places in the AUTO pfolder. If it is after
the Nova drivers, it makes the system run in monochrome
and the res changing CPX claims the Nova's not installed.
Any ideas?
Thanks,
scott tirrell
stirre31@maine.maine.edu

A) The "Es gibt nur einen" is complete and utter nonsense !!
B) There are people using TCP/IP stacks that do not support Newsie.
C) This is an english newgroup, you gotta talk english here.

Cheers Peter

Dick,

I'd also like one.. just curious if you've had any responses?

Of course, Computer Direct carries them new, but I don't
have the budget for that yet..

>I have a few simple questions:
>
>1. Monitor - what kinds work? What are the pin-outs on the monitor
> jack? Some versions seemed to have had an RF modulator, can one
> be used with this version of the machine?

You can get a Hi-res SC124 (640 x 400) monochrome monitor or a SC1224
color monitor that does Med-res/Lo-res (640 x 200 and 320 x 200 each)
from this newsgroup or many Atari dealers for relatively cheap. You can
also use a switchbox/special cable with a multisynch to get all Res's on
on monitor. Be advised that kind of monitor has to be able to "synch" on
down to the ST's level (15hz). An RF modulator is so you can play it on
a TV...You can use it if there is an RF port...

>2. Floppy drive. Is the DOS in ROM? If so, how can I format a disk
> and can I read these disks on a PC or Mac?

Its not DOS (gasp!), but TOS (The Operating System). Yes, its in ROM.
A drop down menu item will allow you to format standard DS/DD disks
at 720k that can be read by a PC (or a Mac if you set it to read DOS
formatted disks)

>3. Hard drive. What does it expect? SCSI?

Yes, Atari ST's have their own version of SCSI so you have to use a host
adaptor such as ICD's "The Link"...and driver software which comes with
the host adaptor, or get the best, HDDriver... :)

>4. Operating system. Is it in ROM? If not, which is the best for
> these machines?

TOS is in ROM...and offers several advantages because of it. If your
machine has TOS 1.02 or earlier, you really, really need to upgrade it
to at least version 1.04 (Rainbow TOS). Its faster and more reliable.
It also is a plug'n play upgrade. If you can afford it, get an adaptor
card and put TOS 2.06 in there-its love at first byte, er sight...! :)

>I've looked around and while there is a wealth of great information out
>there none of it seems this basic.

Sometimes it seems that way. There is a Quick-FAQ for users such as your
self... Hey, Nick! Can you point this would-be Atari user to your FAQ? :)

>Helpful answers appreciated!

We aim to please...! :)

Source record: 118045

Sorry for this waste of BW, I know STs are about much more than games, but I need a little quandary cleared up. When my ST was still in working order many years back, I played this game incessantly. I thought the name of the game was Bubble Ghost but after reading a descrip of that game I think I am wrong. The scenario was you were this thing, a bouncing ball and you could go in these pipe things up and down levels or catch these coloured droplets of stuff to give you more power. I kno wone thing you could do was to stabilize the ball or shoot coloured droplets at enemies. Anyways, there was a bout 5 levels or so and I remember I got really close but never finished it. Great game. What am I thinking of?

>
>Hi, guys, in my NEC 4x cdrom drive manual, it says to terminate both the
>first and last items in the chain. I always thought just the last. Was I
>wrong? Thanks in advance.

Hi Cory,
Both statements are correct, depending on how you look at things...
The rule is to terminate the first and last unit in the SCSI-chain, but the first link in the chain is, of course, the controller (which always is terminated), so you only need to worry about the last unit - and I'm not speaking of the unit number, but the last unit on the cable - regardless of SCSI ID number.
A perfect chance of misunderstanding about termination is that most PC-SCSI-cards have the possibility to switch the controllers' termination on and off, but you don't need to worry about that on an Atari ;)

Best regards,
Claes

There used to be a board available from Germany that could do this, but it's long gone, and will probably be very hard to find. Today the easiest way to connect a HD is SCSI with an ACSI/SCSI host adapter.

Titan in the UK is selling an IDE adaptor board, from TUS. But although they are advertising it, I asked a few questions and their reply was that they were waiting fro input from TUS Developments. I've also emailed TUS twice and they don't reply. This leads me to beleive that the TUS IDE board is vapourware at the moment.

Has anyone tried this board yet ?

Aloha,
I have a megaSt with an external 20Meg HD. Thr HD is a little over 10years old (bought it when they first came out). Anyway, it's starting to act flakey and sometimes powers down midway through it's power-up cycle.

I'm using Cabase 2.0 and am very happy with it and the Atari.

Now I'm wondering if I should switch everything over to the PC. Since Atari is now defunct, if I totally lose my HD do I have no recourse but to purchase an older 2nd-hand HD? Or can I somehow hook up an external PC drive to the mega? This would be my best shot since I can but that at a local store.

This seems like a question that most people would be interested in.

Thanks in advance,
Greg

Good point. You can get round this by using the appropriate magic calls
iirc, but it doesn't help with older software of course.

Source record: 118053

Sorry for asking such simple questions but I just came across one of
these at Goodwill and it seems to be working (power light comes on,
floppy drive light comes on)

I have a few simple questions:

1. Monitor - what kinds work? What are the pin-outs on the monitor
jack? Some versions seemed to have had an RF modulator, can one
be used with this version of the machine?

2. Floppy drive. Is the DOS in ROM? If so, how can I format a disk
and can I read these disks on a PC or Mac?

3. Hard drive. What does it expect? SCSI?

4. Operating system. Is it in ROM? If not, which is the best for
these machines?

I've looked around and while there is a wealth of great information out
there none of it seems this basic.

Helpful answers appreciated!

Not to make light of the real and present danger, but it's difficult to
make the adjustments without the monitor being plugged in, turned on, and
connected to a booted-up ST! The ugly blackish blob on the top of the
front edge of the picture tube is to be avoided, and be very careful
around the pointy end of the tube as well. Invest a few bucks in the
"Color tv Repair Kit"--a set of long plastic adjustment tools, and
reach into the monitor with one hand at a time, keeping the other one
back; that's said to reduce the hazard of a misplaced electrical charge
making your heart part of the circuit. There is a convenient program
which generates squares, circles, etc., for use to tweak the adjustments to
suit.

The controller itself counts as an item, but is typically already terminated. Therefore, you are correct, as with most SCSI controllers, all you have to worry about is the last device in the chain, and NEC is correct, as the first device (almost always the controller) needs to be terminated (but almost always already is).

It is possible to have a unterminated controller, and it is possible to have a controller that is in the middle of a SCSI chain instead of one end, but in the real world, you are unlikely to see either.

Hi Austin,
Get a standard PC-drive - no need to worry about it being 1.44MB - it's
usable anyway.
I believe the best ones to use in your Atari are Sony and Teac, but you
should make sure that it's possible to change the unit number between DS
(drive select) 0 and 1. All PC's use DS1 for both A: and B: and to get it to
be unit 0, they use a twisted cable for the A: drive (so the salesperson
probably won't know what you're talking about). The trick to get it working
is to set the drive to DS0 - otherwise the Atari can't use it, then you
connect the flat ribbon cable upside down (there is a coding pin on the
connector's edge that probably makes it hard to fit, but it should be turned
the "wrong" way). If you try connecting it the wrong way, nothing happens -
only that the drive doesn't stop spinning at start-up - you don't destroy
anything.
You should only turn the ribbon cable the "wrong" way around - NOT the power
(if you do, you'll fry the drive and never get it working).
One thing that might happen is that the drive doesn't recognise that the
disk has been changed, but there is a hardware fix for that - I just can't
remember now. Otherwise, if you do a "force media change" by pressing the
escape key when the A: window is open.
Most Ataris don't have this problem, but some do.
Another thing that's very probable is that you can't use specially formatted
disks - only standard 720kB disks.

Good luck!

Hi,
Most Amiga mice are switchable between Amiga and Atari, so if you can find
an Amiga retailer, he probably has a mouse for you.

This is unlikely because for the hard disk driver the drive type (e. g.
EZ, SQ, MOD etc.) makes no difference. All these drives are drives with
removable media and this is all the hard disk driver has to care about.
The exact drive type doesn't matter at all.

Bonjour Pascal,

Will wonders never cease. First, congrats on getting the pppkit to work with
your setup. I have always had a SLIP account, so don't need the pppkit.
The reason I put mintnm last was that's what the MutiTOS User's Guide says.
I tried moving mintnm up in the Auto folder, as you did, and it worked fine
also. So much for following the instructions :) BTW, I have 4 Auto folder
setups. One for STiK, STiNG, ST+, Clean boot. Just lots of fun...

I noticed your using fast_serial. Good for you! If you put HSModem7 (drvin.prg/scc.prg) in there instead of FS, I doubt if it would work properly. It's much more sensitive to conflicts. Also, I noticed your using ledpanel. This prg bombs if you try to boot load TOS4.92 and causes an endless cycle of boots and re-boots ;(Of course with MiNT1.142/NVDI there is no reason to use it :) Merci beaucoup.

Regards,

Charles

I doubt that. Johan? ;-)
Pure C compiles the code and that's basicly it.

> compiling for. Still I use gcc for bigger Projects, because I like to

So then it wouldn't cause any troubles if someone wants to write
a module for CAB in C to give it floyd steinberg dithering as an
option. Just compile the c code and link it. :-)

Could be a difference in versions here. I got my LIMITMEM with MagiC
v2. It is documented on page 40 of the manual.

Michael,

Go with the SCSI version of the ZIP drive, this way it will work with
ExtenDOS and you wont run into problems. A parallel ZIP drive may work
if you buy the TRAVELLER adapter and use the a SCSI II to SCSI II cable
and the ZIP SCSI II to Parallel converter, we use them on PC's here are
work with the DOS "GUEST" program and they work fine (slow, but fine)
If you ran PC Ditto or an IBM DOS emulator which gave you access to the
parallel port, you could run that in a window, run GUEST, access the ZIP
and move data to a from it, kludgy, but it should work, good luck.

I own an Atari ST, and being offered a used Atapi
CD ROM Module (external) to be connected via the
parallele printer interface I'm faced to the very question:

Is there any Atapi driver for the Atari ST Platform?

: saying it shouldn't be used?
:
: And how should shel_write be used if one is calling a program from the
: desktop?

You did not tell that you want to call a program from a shell.
All Shells for MagiC use the shel_write method. In Magxdesk you can
configure this by "install application".
As far as I know limitmem is not longer part of MagiC 5.13.

An "extra" one? :^)

I didn't have one at all, but adding one seemed to do the trick. Makes perfect sense, since it worked fine in the background, when it was slowed down.

Thanks for the tip! That was really bugging me.

2173. Re: Atari HD biting the dust

Newsgroup: comp.sys.atari.st
Date: 1997-08-19 00:00:00 UTC
From: Greg Malick <tiger@hgea.org>
Message-ID: <33F9BB40.9D1@hgea.org>
Source record: 118223

Aloha again,

I Found this FAQ on www.ccn.cs.dal.ca/Technology/NSACUG/faq/faq3.html.
It raises more questions:

Has anyone recently tried this? Are Host adapters still available? s
this the next weak link in my hardware chain (i.e. will these go out of
production) Are there limits to the Drive size a megaST will handle? Can
they be in GigBytes? Can I chain SCSI devices (would I need multiple Host
adapters)? Could a SCSI ZIP or JAZ drive be used in a SCSI chain (assuming HD
has to be device#1) Has anybody had great (easy) success with specific
drives?

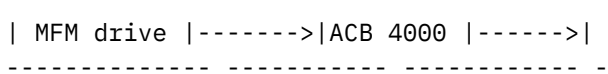
Sincerely,
Greg

Here's the FAQ: (date unknown)
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac
except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with
Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look
for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:



3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put the drive internally, you will need a case with power supply to house the adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you use IBM case, the 150 watts power supply for that type case can drive at least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for FM/RLL),
it's 50pins IDC female connector on each end with 50 conductors cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again. And check the jumper setting on the drive (consult the drive's manual). If you are using more than one drive with the system, make sure only the last drive has the terminator (either a DIP or a signle inline package of resistor, which usually is socketed and close to the SCSI connector on the drive circle board.
Remove the terminator from other drives. [only the last drive should have the terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5 from ftp sites.

>

Nothing if you are lucky. Put an ad in the local free paper offering to buy *broken* ST or STE's. If it goes anything like it did for me, you'll get a decent response.You'll find its mostly the psu, floppy or keyboard. All these parts are interchangeable although sometimes you have to be hamfisted to physically get an STE psu into an ST - they will go in though. Most people will take what you offer, some will let you have it for nowt just for taking the trouble to turn up. Remember, most of these machines will either continue gathering dust or end up in the bin, so consider it a salvage operation and don't offer too much initially. :-)

Last time I looked, new keyboards cost about 40 quid, perhaps a tad more.

2179. FSii available?

Newsgroup: comp.sys.atari.st
Date: 1997-08-19 00:00:00 UTC
From: mark@kaisun.demon.co.uk
Message-ID: <33faf93e.6681103@news.demon.co.uk>
Source record: 118229

I recently found a copy of "Your 2nd Manual" book with disks. It
mentioned FSII flight Simulator for Atari ST and I assumed a demo was
on one of the 3 diskettes with the book, but no dice 8:-(

Am I missing a disk? I love flight sims and have a big collection
spread across my Acorn, PC's and ST's. I would dearly love to know
where I could get FSII (I already own FS 4,5, 5.0a and 6! for the PC)

Could someone let me know what the program was like please!
From Mark Shaw, in Carlisle, Cumbria, UK.
Use Linux and Win95 for the best of both world's!

2180. Formating a SEAGATE 1096 for ST

Newsgroup: comp.sys.atari.st
Date: 1997-08-19 00:00:00 UTC
From: Rolf Hemmerling <hemmerling@geocities.com>
Message-ID: <33F9F25A.63753DEF@geocities.com>
Source record: 118230
Cross-posted to: fido.ger.atari,comp.sys.atari.st,comp.sys.atari.st.tech,de.comp.sys.st,fr.comp.sys.atari,maus.sys.atari.hardware,maus.sys.atari.talk,maus.midi,comp.sys.atari.advocacy

I need the low-level format parameters for the Seagate 1096 (83.4
MByte), a SCSI drive, for the ATARI-ST

a) the WINCAP file (or entry for the WINCAP file) for use
with HDX.PRG version 5.04 or newer

b) The parameters needed for the low-level format procedure by
the SED Harddisk editor (by Scheibenkleister, C.Brod)

- Number of heads
- Number of sectors per track (?26)
- Number of tracks
...

In general, I am using the CHBD.SYS harddisk driver by Scheibenkleister
(C.Brod), because it allows both SCSI and MEGAFILE devices to be
connected.

c) Alternatively, is there any site with such informations (for SCSI,
even for RLL or MFM drives) ?

The computer to which the SCSI drive is connected has a DDD harddisc
controller (DDD = Digital Data Deike, Hannover, Germany). So there
is a special format utility.. but we don't own it currently. And we
would like to use CHBD and SED, because of compatibility reasons.

Generally, if I should get other harddisks (from PC), it would be
very interesting to know how to get the necessary parameters, generally.
So if I misguess the parameters.. probably the format (or at least the
partitioning and the copying of the driver) fails.

If You have a collection of new entries for the WINCAP file, I would
be interested anyhow !

If You know any other newsgroup useful for posting such topics, please
tell me.

Sincerely
Rolf

Cannon/Navarone 300 DPI B&W Sheetfeed scanner, inclues interface for
ATari ST, scanner and driver software. $65.00 + S/H
Works as a great photocopier if you have a SLM-804/605 laser printer!!
First sold for over $1200

Chinon 1X SCSI CD-ROM Drive unit. Internal Drive Model #435
Verifyed by Extendos Programmer to work on ST's.
I simply purchased a dealers lot of these when I needed a few for
myself. $9.00 each + s/h Includes drive mech & (1) caddy each.

Calamus SL dtp program for ST/STe/TT/Falcon
I purchased this awhile back myself and just don't have to time to
learn this powerful program. Reciently sold my TT to make room
for our first child, so time will be less available than before even.
A deal at $50.00 + s/h

I also have a few extra SLM-605 toner cartridges.
Purchased out a dealers clearnace and will pass the savings along to
you. Don't pay the Office Depot price of 1 for $15.00
I'll sell them 2 for $12 + s/h

Purchaser must send either personnel check (subject to hold until
clearning) or money order. Purchaser pays shipping in all cases.
Shipping charges from the San Diego CA area.

I also have this problem with TruePaint, StudioPhoto, and Papyrus. I think
it has something to do with the color palette. These programs act as if
they are being run in 16 color mode (ST medium). I think it is a problem
with the NOVA drivers, but I can never get any answers from the developers.
I wonder if there is a way to get these programs to recognize that they are
not being run in 16 color mode? Other programs such as Photoline, Gemview,
and CAB have no problems at all. Both TruePaint and Papyrus use HySoft's
EFMS system - obviously this entire system has a problem with the NOVA card.

>Any ideas?

Disable all programs in your Gemsys folder named NVDI*.sys, or any other
files related to the NVDI screen drivers. The NOVA card has its own drivers
and therefore the NVDI drivers are not needed (can't be used). You will
still need NVDI for printing so leave all GDOS or printing related
files intact.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tec

Hi All,

I have a Falcon running MiNT, MiNTNET, MiNTOS acting
as a Telent, FTP, Http server. I can sucessfully
establish a TCP/IP Link from the Client to the Server,
but when using client programs I allways have to
refer to the server using the IP Address (currently
100.0.0.1). I would like to be able to connect
using the server name and domain. Does anybody
out there know of any Data Name Server software
for MiNT, so that I no longer have to use the IP
Address?

Please E-Mail me as I have limited Usenet Access.

Thanks,

Ben Hills.

You can also get the 9 to 15 pin VGA adapter from Dalco (www.dalco.com)
for $4.99 I believe. It is listed as a multisync to VGA cable.

2186. NVDI for Nova VME graphics card

Hi Guys,

You have any idea as to where I might find an NVDI version that can drive my Nova VME graphics card (made by Computer Insel in Germany) on my Atari TT? I tried the NVDI ET4000 v2.x, but this version doesn't recognize the Nova card.

Hi You have to make sure the drivers for NVDI in the gemsys folder are the ones for the graphic card they should be on the install disk. NVDI is supposed to run properly with nova. In image copy you have to set the program to run properly for the graphic card. It is in settings menu. My friend had the same trouble with a Matrix card until he set everything.

With magiC works fine all programs but you have to set the environmentals in the magiC inf properly for the res which you boot in your magic inf file should look something like this at the top.

Source record: 118066

About 6-8 months ago I bought Infopedia 2.0 and the Atari CD-Master program that goes with it for my Atari Falcon 030. I was really excited about having access to all that information. Unfortunately, it consistently crashed every single time I tried to use it. Over the last few months Nima Montaser from Homa Systems has corresponded via E-mail with me, trying to achieve a viable resolution. Finally, it was determined that a new indexing system was being used in v2.02 of the Infopedia CD (which is the version that I have) and Nima E-mailed the entire upgrade to me, free of charge (around 2-3 megs!). The upgrade cured most of the problems. Its not perfect (yet!) but it does not crash now, and is useable... I have faith that the hard-working crew at Homa will have the rest of the problems cured before too long...full kudos to Nima and Homa Systems for their support.

Its really nice to be able to post messages like this... :^D

I figured it out after some late0night snooping. The name of the game is
Wizball. The object was to colour the landscape by collecting coloured
drops of colour. Red, green and blue. Great great great game.

Next question: is there anywhere I could buy this game for either
Pacifist/ST or IBM platforms? I did own a copy for the ST, but I haven't a
clue as to where my old ST disks are.

thanks for the help!

Hi everyone,

There's a new demo of Mole Mayhem available from my web page.

Point your browser at http://www.users.zetnet.co.uk/polonowski/

Mole Mayhem is STE and Falcon compatible and requires 1 MByte of memory.

This new version features three brand new soundtracks which will be in the
full game...

ATB,

>
> Marble Madness, perhaps :-)

No, I know this one. It was by Ocean and called Wizball. There were a lot more than 5 levels and I never finished it either. You bounced a ball and could gain extra abilities by shooting coloured droplets that came at you like waves. There were other enemies too. the extras gave you better control of the ball and other such things. When you cleared all the enemies and coloured droplets on a wave, you finsihed it. Some waves involved going to the next one before coming back and finishing previous ones - at least I had to anyway ;-)

Probably one of my favourite ST games. Certainly the one I played most.

Can someone please help me???

My falcon suddenly started to flikker the screen. After that I switched
off the computer, but when I switched it back on, there was no display
at all on my monitor. That was some days ago. Now it displays a blank
screen when booting-up. The Atari-logo doesn't show up though...
Is there anyone who can help me solve this problem?????
If it won't be solved, I will have top say my dear old Falcon goodbye
:-(((

Many thanks to all help,

You could collect three different colours Red, Green and Blue and the idea
was that you collected varying proportions of each to mix the 'right'
colour for that level (ie. 50%:50% Blue to Red would give Purple etc.)
You had to mix three colours per level, the point was that you could only
get a particular colour on one level (ie. all the droplets on level one
were red, I think), so had to have 3 levels accessible at all times. It
had some silly plot about a bad wizard stealing all the colour from the
place it was set, and you were a good wizard who was sorting it all out.
When you got three colours for a level, some nasty music would play, the
whole level would scroll before you and then that level would be done, and
another start. (hence always had 3 levels accessible). you moved from
level to level via pipes in the ground, but most of them weren't marked,
which could mean much frustrating going up and down til you found the one

you wanted. You could only collect said paint when you had got your cat
companion, which you got as the 3rd power up. You got the power ups
by collecting pearls, which you got from shooting these funny
green pine-cone sort of things, which appeared whenever you lost a life,
semi-randomly on moving levels, or if you shot a whole wave of baddies.
It had a sort of bug, where if you got the weapon which made a wavy line
come out of the top and bottom of your ball, and also had the cat, you
could just lurk on floor and collect all the paint -- the only ways you
could die were
-- if some of the paint hit the unprotected side of the ball
-- if some nasty aliens came along, and shot you (which didn't
happen very often)
-- if the cat ate a pink droplet of paint, which made him mad
and wouldn't do what you want
-- if the cat ate a black droplet the whole screen went black
and you couldn't see
I liked it too

2200. MagiC, Memory thief?

Newsgroup: comp.sys.atari.st
Date: 1997-08-20 00:00:00 UTC
From: james.pirie@zetnet.co.uk
Message-ID: <5tfims$h64$1@roch.zetnet.co.uk>
Source record: 118076

Hi everyone,

Does anyone know where my memory goes? On bootup (Falcon 030 running Magic V4 and Ease, NVDI 4) I have a respectable 2.5 Mb or thereabout to play with out of the 4Mb total. However as I use the system, mostly with CAB and during any Rez changes, I loose the RAM and it never comes back, well not until I reboot anyway and that takes for ever due, I think, to a lack of internal HD. Anyway the big mystery is what happens to this RAM?

Any suggestions welcome,
Thanks.

Hi everybody!

A friend of mine has the opportunity to get a 1040ST really cheap. So he decided to check first if the system is ok. Bu the only thing his ST does after being turned on is to present a BLANK screen! :-(No icons, nothing.... :-((
Does anybody know this? Any solustions? (First: Is this a "bad" behaviour? I'm not an ST user, so I don't know.)
And: How can you get a bootable disk from? Can you create it after the ST came up from TOS?
Finally: I have a file called hddriver70_demo.zip . Is this a driver suitable for an "SHC 204/205" hdd?
Thanks in advance for your answers! :-)

Ti> need multiple Host adapters)? Could a SCSI ZIP or JAZ drive be used in
Ti> a SCSI chain (assuming HD has to be device#1) Has anybody had great
Ti> (easy) success with specific drives?

The LINK is a SCSI host adapter. And B&C in California sells it.
AFAIK there is a LINK 97 now, and I guess nobody knows if they will
go out of porduction (everything does some time I guess). I think there
is a drive size limit of around 2 Gigabyte for the HD, but that depends
on the OS your using. If it's TOS your probably have a drive size limit,
if your using the latest OS'es like Magic or so, I don't think so.
You can hook up to 64 devices to your Atari ranging from
Scsi id 0, lun 0 up to Scsi id 7, lun 7. I have 60 CDRom's attached
to my Atari 260 ST all at once, using Meta-DOS.
A SCSI ZIP or JAZZ drive can be hooked up too, but AFAIK you need
special drivers. They exist, but you need to purchase the software.
I always use Conner Hard Drives (1 GigaByte), because they're quit.
Now Seagate has taken over Conner. Nowadays you can pick up a 3 GB
drive for $200 or so?

Yeah, I got mine with MagiC v5.11 (my first version of MagiC). The docs are
rather sparse (in fact, the manual is actually for v4).

FWIW, I don't think an 8-bit lightgun (the one that came with the
XEGS game system, I believe) has the proper connector to plug anywhere
on an ST - however, I wouldn't be surprised if some enterprising boffin
has found some way to rewire it...

>
>Also what will it take to get me online with it(software etc..) Can I
>use my current ISP provider with changing to a shell account?

Currently as long as your account offers some sort of SLIP
protocol, you can access that account. Just use STiK if it's straight
SLIP, or STiNG if it's CSLIP. If it's PPP protocol, just wait until the
new version of CAB (2.5) is released in English, as it now has a PPP
socket program included with it (OR if you're a really enterprising and
brave soul set up PPPKIT or MinTnet/Minix :))

What
>about checking mail and of course web browsing?

If you're using STiK as your socket program, NEWsie and CAB will do
you nicely. The PPP socket with CAB 2.5 will only allow you to run that
program so far (but modules compatible for that are being written as we
speak)

Oh, whats the Ideal ST
>setup(ie:4+ megs of ram, harddrive etc...)?

Fout megabytes in an ST is the equivalent of shoehorning a Porsche
Boxster engine into a VW Beetle - plenty of power. Hard drive - the bigger
the better, as long as it's SCSI and you have a proper host adaptor to
link it up. To give you an idea, I'm running a Falcon with about 325 mB
of hard drive space (with DEC and IBM 100mB mechanisms, and a Syquest
EZ135 removable portable drive) and I'm nowhere near filling them up :)

2209. ** EM-Encrypt 1.0 **

Newsgroup: comp.sys.atari.st
Date: 1997-08-20 00:00:00 UTC
From: alle8965@kutztown.edu
Message-ID: <5tdlfs$74i$2@jake.esu.edu>
Source record: 118085

Hi! I'm currently writing an Email encryption program for various ports of Unix, especially Linux. I'd like to write an Atari port, but I have no way of compiling one. If someone out there uses G++ and is willing to help, I'll be happy to throw in your name for a thank you, plus be forever in your debt :)
The program, so far, is very simple. It will take any text file and encrypt it using one of many pre-defined coding schemes. The receiver must input a special code in their copy of EM-Encrypt to decrypt the message. Right now it's only text based, so any Atari version will be Tos and not Gem based, but I hope that will change. I have a friend who's looking to learn Gem programming, but for the moment he doesn't even have a compiler, so he's no help :)

In any case, I thank in advance anybody who can help. If you're able, please email me at alle8965@kutztown.edu to set things up or for further info. (by the way, the program will be freeware on all platforms).

Thanks again,
Matt Allen

2210. Ethernet card for Falcon...

Newsgroup: comp.sys.atari.st

The STOP&LOCK CPX coming with SCSITOOL can do this. STOP&LOCK runs with
any XHDI compatible driver.
It's quite easy to write such a program on your own. Have a look at the
XHDI specification, especially the call XHLock() which locks and unlocks
drives.
BTW, why do you want to lock your drive at all? I can't think of any
program that would eject your cartridge without any reason. And even if
there was such a program, ejecting wouldn't damage your cartridge.

For SCSI drives you don't need any parameters. Simply format it using
HDX, SCSITOOL, HDDRUTIL, ...

The LINK96 and LINK97 also support 7 (not 8) devices. ID 7 is reserved
for initiator identification. This features makes the LINK96/97 the only
host adapter that can cope with Quantum Empire and Fireball drives.
These drives require the computer or host adapter to have its own unique
SCSI ID.

> There are no real problems with ANY drive. Seagates are cheap and

If you don't have a LINK96/97 you can be sure that you run into troubles
with current Quantum drives, see above.

2215. SCSI-Harddisk problem in CAF

Newsgroup: comp.sys.atari.st
Date: 1997-08-20 00:00:00 UTC
From: epkrgdh@epk.ericsson.se
Message-ID: <5te5ca$ohi@newstoo.ericsson.se>
Source record: 118091

I have a problem when recording audio-tracks in CAF after been added
another scsi harddisk.
When I've recorded a track and want to listen to it right after, it sounds
like hell, I mean it sounds as half bitrate and metallic, when I switch
to the other harddisk it sounds great and I switch back and it sounds
shit again. Sometimes when I play the sample it sounds normal and then I
press stop and play again and now it sounds shit again. I have even tried
to run from both drives at the same time and one drive it sounds perfect and the
other shit. I've gone through all the scsi-chain to locate the fault, but
I haven't figured out what, yet.
I have tried to re-format the drive several times and different harddisk-drivers
with no success.

My setup:

cable: computer -> 2 Gb scsi -> 1 Gb scsi -> ez135 -> cd-r -> cd
scsi-id: 7 0 1 2 6 4

2 Gb: Seagate Hawk ST-32155N (the faulty one)
1 Gb: Seagate Hawk ST-31230N
CD-R: Yamaha CD-R 100
CD : Toshiba 520

The last in the scsi-chain has the terminators and I have also tested
to run only the faulty drive (with term on that drive), with no success.
The harddisk itself seems to work in other cases, I have tried to
save normal files to it and it works great then, I have made several
audio/backup cd's using that drive with great success so it is in CAF
it screws.

Any tip?

rgds

Don't say that ;) The SyJet is said to have a very good eject mechanism
which often kicks the cartridges completely out of the drive so that they
fall to the ground. And I've read the cartridges sometimes don't survive
this, for whatever reason.

Ciao

Anyone have a clue as to what C-Lab did with the Falcon MkII? It has
an internal SCSI drive (a Quantum Daytona in my case) which is
connected where I'm told there would usually be a resistor-pack -
there are three sets of five pins which stick out of the motherboard,
the MkII has a small circuit-board attached which links via a SCSI
ribbon cable to the drive.

My attempts to attach a Zip drive have been pretty hopeless so far,
because I can't work out how to remove what I assume is a properly
terminated internal drive so that I can attach the Zip to the SCSI
port on the back of the machine.

If you have a Falcon MkII and have managed to attach a working
external SCSI device, I'd love to know how you did it!

TIA,

The following items are up for sale. Please email offers.
All software is original disks and includes original docs.
There is some other stuff... a PC Ditto board w/soldered
68000 cpu, Spectre GCR w/roms, Migraph Touchup w/scanner
(the power supply for the scanner is missing so it is not
tested yet, if anyone knows the specs on the ps, I'd
appreciate the info), IMG scanner, a whole suite of the
Cyber software, etc. As soon as I can get to it and test
these, I'll post them. Everything is "make an offer". I'd
be interested in trades for a hard drive (nothing elaborate,
a 20-80 meg supra or ICD or whatever setup would be fine.)
I'd also be interested in trades for midi sw/hw or a set of
TOS 1.4 roms (although I haven't even checked to see if I
need 2 or 6 chip sets.)

Ed
Balt. MD

HI all.
Whatever happened to Crackart? Is it dead in the water like Freeze Dried
Terminal? Is there a Falcon version if you register? Is there an official
English version with docs? I have a partial English translation of the
docs if anyones interested.

Dave

2225. FS: TTM195 Atari 19" monitor (US)

Newsgroup: comp.sys.atari.st
Date: 1997-08-20 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5tems4$c3b@alexander.INS.CWRU.Edu>
Source record: 118101

It is the one used for a TT in TT-high resolution (1280 x 960).
AFAIK, I does not work on other computers.

You can use a special Atari monochrome monitor (or OEM copy) which is GREAT for anything but games. Look for SM124, SM125 etc. in this newsgroup at about $50.

You can also use RGB monitor. If you can find a cheap NEC Multisync. 3D you will get both modes in one box!

If you have a TV with SCART input you can often persuade it to display the ST colour modes (Low and Medium Res.)

Yes, any model with an "M" in the model code will have a modulator. I don't think it's worth adding one if you haven't already got it. The quality is not good and second-hand RGBs are cheap enough.

Pins:

1 Audio Out
2 Compopsite video
3 General Purpose Output
4 Monochrome Detect (active low)
5 Audio In
6 Green
7 Red
8 +12v
9 H Sync
10 Blue
11 Monochrome
12 V Sync
13 Ground

>2. Floppy drive. Is the DOS in ROM? If so, how can I format a disk
> and can I read these disks on a PC or Mac?

Yes. Probably a 6 ROM set with 192Kb of TOS, GEM, AES.

>3. Hard drive. What does it expect? SCSI?

Ha! The DMA port has a protocol all of its own known as ACSI (nearly
SCSI but not near enough!). You will need a "host adapter" to connect
to this port which will then deliver real-SCSI to you device bus.

>4. Operating system. Is it in ROM? If not, which is the best for
> these machines?

Yes. All but the very earliest models have TOS in ROM. If it is <v1.04
it will be poor at handling HDs. You can either get replacement ROMs
or find yourself a copy of MagiC which is a replacement OS loaded from
disc. Muttitasking and significant performance improvement.

Since I am about to change my TT's original ST157 for a bigger HD,
and install a ZiP drive through the external SCSI connector, are
there any specific things to be aware before pluging those drives?

I *do* remember that some drives need to have Parity disabled, but
otherwise, is there anything else I should be cautious about? Also,
since I'm using an older version of HD-Driver (5.13) what should I
use to format the new drive and the ZiP cartridges?

Thanks! ;-)

Have had the 720Mb drive (fitted by TUS) for about a month - no problems with it so far - the fitting instructions look fairly simple for anyone competent with a soldering iron. Can now use my 180Mb MiniS/Link as backup.

Apologies if format etc. is wrong - it's my first attempt at a newsgroup.

Wizball, Ocean Software

One time I ever got near to finishing it (it took about 3 hours) the
computer crashed when I'd coloured in all of levels 1 -> 5 and most of 6,
7, and 8. Gutted -- I nearly threw it out the window

A true Atarian :)
Hummm, TOS in ROM, AFAIK you don't need a disk drive to have it boot up.
The OS is in ROM so... You can't load ST stuff or save it, though.
So you wouldn't be able to run Midi software. I just recently bough an
Atari disk drive on a Pc dump fair for $5, so shop around.
A power supply is missing too. If you're technical, you could make
your own. Someone has the pin connection and Voltage/Ampere values?
Or once again, look at a shop who dumps computers...

Di> There is a "SIO to PC" cable which enables you to use a PC as a hard
Di> drive for the Atari 8bit computers, works great! Is there something
Di> like this for the st? Also, I have a bunch of Atari 8bit disk drives,
Di> could I connect these to the st?

There is such a thing for the ST as well. Using ST-XL Link, you can have
your ST act as a hard drive for your 8 bit. You can connect a
1050 drive to your ST, and have it load 8bit programs using ST XFormer.
This program emulates an Atari 8 bit (just like PC XFormer on the PC).

Di> Also, if there is a st perhiphrial emulator and cable I can build so I
Di> can use my PC's hard drive, or, if I can connect an Atari 8-bit disk
Di> drive, all the books go for just the power supply and mouse.

Btw, the ST XFormer uses a special I/o connector, but you can build
it yourself. How? Download ST XFormer somewhere (if you're not able
to, let me know, I'll email it), and there is a description in there
on how to build it.

Aloha too,

you're probably referring to that old shoe box called SH204? :)
If you open it, you will notice that there is probably a MFM hard drive
in there. There will also be a MFM to SCSI converter in there.
It shouldn't be that difficult to find another MFM drive with that capacity.

If everything fails, you could by a LINK SCSI adapter for your Mega,
and a fairly cheap SCSI drive. Shouldn't cost more than $200?
That's always cheaper than a new system...

Bo.

Can't help you much, but I run the Nova with NVDI 4 and all works
very well. I installed NVDI after installing the Nova; the
installation program was smart enough to recognize the Nova drivers
and not install the NVDI drivers. Maybe reinstalling NVDI would help.

For multitasking, I use Geneva and have seen no problems so
"multitasking" wouldn't appear to be the problem. ImageCopy 4 also
works well with the combination; make sure you select
Options/Screen/Display/Auto Select for Video.

Good luck,

Pat

2236. Where to find TOS 4.92 aka 5.0, and Falcon demos???

Newsgroup: comp.sys.atari.st
Date: 1997-08-21 00:00:00 UTC
From: lynxpro@aol.com
Message-ID: <19970821065301.CAA20978@ladder02.news.aol.com>
Source record: 117982

I've already posted here before, and I have had questions answered and I thank everyone for that.

But my question now is, where can I find TOS 4.92/5.0? I've heard that its available on several FTP sites, but I haven't been able to find any.

Second, DOOM was converted to the Falcon, from what I have seen. Unfortunately, the webpage listed (at AtariCentral) to get the game is not up and running, at least from here at AOL (using Netscape Communicator).

Third, I am looking for a few cool Falcon demos that I used to have/seen. The one demo I really want to get my hands on was a demo that took up about 14megs on the hard drive, and it was compiled by either AtariUK or Atari Australia. It was basically a sales pitch to sell the Falcon, and it had extensive sound effects/music using the DSP, and several excellent graphic files to it, along with a narrator. Another demo I'd like to find actually took up 14megs of memory, according to Atari employees when I saw it. It was a 3D flying demo, and it was spectacular back in 1993.

Anyways, thanks again Atarians!

Sincerely,

Jeremy W.

No, as long as you don't want to use the ZIPs read/write protection
features. Current versions of HDDRIVER can handle this.

> I *do* remember that some drives need to have Parity disabled, but

Parity must only be disabled if you have an host adapter that doesn't
support parity. For the TT and Falcon I recommend to switch parity on,
especially if you're using a driver with parity check, like HDDRIVER. In
this case enabling the parity check results in better data security.

> since I'm using an older version of HD-Driver (5.13) what should I
> use to format the new drive and the ZiP cartridges?

Use HDX, SCSITOOL, HDDRUTIL (HDDRUTIL supports formatting since version
6.0)...

> is a drive size limit of around 2 Gigabyte for the HD, but that

There is no limit for the capacity of an SCSI drive you can use with the
Atari and the LINK96/97. There is also no limit if you have a TT or
Falcon. The only limits imposed by TOS are related to the maximum
partition size. Depending on the TOS version the maximum size for a TOS
compatible partition is 1 GByte, for a DOS compatible partition 2 GByte.

> A SCSI ZIP or JAZZ drive can be hooked up too, but AFAIK you need
> special drivers. They exist, but you need to purchase the software.

You don't need special drivers at all. Only if you want to use the
read/write protection features of the ZIP/JAZ you need software with
support for this, like HDDRIVER.

I don' think so. As I said before current Quantum drives require the
computer to have its own SCSI ID. The LINK96/97 is definitely the only
host adapter that supports this.

Just get the Atari fixed. It may only be a bad solder joint or a worn
out switch.

If all you use your Atari for is Music, then a PC is going to be a shock.
Atari's are physically smaller than the average PC & are far quieter (no noisy
fan). They boot much faster too. The Midi port is integral in the Atari; the
PC has many add-on options, some better then others.

Switch to a PC & you may find yourself spending time configuring conflicting
port drivers, installing fixups & generally reading a lot more readme & help
files.

Since Atari
>is now defunct, if I totally lose my HD do I have no recourse but to purchase
>an older 2nd-hand HD? Or can I somehow hook up an external PC drive to the

Hooking up a drive is more complicated on Atari's, but of your old HD is
dying; & it's SCSI, then a replacement is easy to get. If it's MFM, then it's
a little harder. Most PC drives do not work in Atari's.

Hi,
It depends on which version of the Nova card you have. Do you have
the ET4000 versio nof the Nova card?

In any case, as of version 2.51 (now the latest if v2.61) of Nova
drivers, you can use NVDI v3.02 or better (now is v 4.1X) and that
works just fine.
If you have a Mach32 or Mach64, you don't need the ET4000 version of
NVDI. You can use the normal v3.02 or v4.
If you hae ET4000, you could use either ET4000 version of NVDI or the
normal one.

Now, telling which card you have is a problem, unless you know which one
it is. If you are unsure, tell me what model it is (e.g VME, VME plus,
super Nova , Plus 64 ,....) and I might be able to help you out.

Periodically run memexamn. It tells you what process owns what chunks
of memory. Once you've found the culprit it *might* be possible to do
something about it. You could even find that you have all the memory
still - in fragmented chunks. This is no problem to properly written
programs.

2245. Help! ICD HD format

Newsgroup: comp.sys.atari.st
Date: 1997-08-21 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5tgf0p$ca9@alexander.INS.CWRU.Edu>
Source record: 118114

HELP!
I have a seagate 525Mb HD, that was originally formatted with
ICDfmt, version 6.5.5, with 6 partitions:
1: 25M GEM
2,3,4:100 Mb BGM
5.6:100Mb OOP (for Spectre3.0)

I recently switched over to HDDriver 6.22, and somehow LOST the two Spectre
partitions! I hadn't run Spectre for a while, and just tried to rerun it
and found that the partitions had gone bye-bye! Fortunately (and most
unusual for me) I had printed out the partition data from ICDformat!!
Sure enough, when I look at the disk partitions with ICDformat again,
the first four partitions are there, exactly as recorded, with nothing for
the last two!!!
Is it possible to recover the two partitions? I see in the panel for
the partition part of the program, there are three boxes:
1: Write partition information only
2: Rebuild one partition
3: Partition entire disk.
If I reenter the old (saved) partition data, does it *TRULY* only write
the partition data, leaving the actual data intact, Or does it rewrite
over anything else?? I would hate to lose 200 Mb of Mac stuff collected over
several years, all runnable under Spectre???

OR, is there some other, safer method I can use???

HHEELLPP!!

Boris.

Message-ID: <122_9708210814@ronly.org>
Source record: 118116

Most MagiC users probably already know this, but as a new MagiC user I just discovered it recently.

If you run a TTP program with the same command line all the time, or simply have it installed for certain file extensions, and you don't want the command line dialog coming up every time, simply change the file type to .TOS in the applications manager. (You don't have to change the actual extension to .TOS.)

Your program will still get its command line (or filename), but you won't get the command line dialog coming up, requiring you to press Return every time.

JP> is what happens to this RAM?

It's probably still there, but it becomes fragmented. Your available free memory is actually just your largest free block. So you might have 2 megs free, but if your largest free block is only 512k, that's what your free memory is for any one program (and what most programs report as being your free memory).

You might want to pick up a program called MemWatch. It will give you a real time graphic display of ALL your memory, as well as both total free memory and largest free block.

From: Greg Malick <tiger@hgea.org>
Message-ID: <33FC53AF.6C48@hgea.org>
Source record: 118119

Aloha,

And thank you ALL for the insightful and intelligent remarks. I really have no desire to give up my ST. At work I use a PC and the remarks by Gerry below are all true. I also have a PC at home which I rarely use except when I do work at Home (YUK!). But I'm considering the cost of the Host adapter(~$120+shipping) and the cost of a SCSI (haven't checked this yet: but an external SCSI may be $400-$500) versus the cost of cross-grading Cubase (hey I spelled it right this time) to the PC and a PC midi interface.

I've added some comments with ***

Gerry O'Rourke wrote:
> Just get the Atari fixed. It may only be a bad solder joint or a worn
> out switch.

*** This is tough because there are no qualified Atari technicians here in
*** Hawaii. I checked when my original ST went down and I ended up buying a
*** Mega4 for $200 (already I'm in this much -- so I must want to stay)
*** Anyway, I'm not sure how I personally would find a bad solder joint or
*** worn out switch.

*** Actually, it's becoming apparent that the drive starts to power down
*** after I've been using it for about 15-20 minutes. First saving becomes
*** a little flaky, then the ST thinks the partition has been corrupted and
*** the red light starts flashing like crazy, and then when I power it all
*** down, a HD power-up starts OK and then it shuts down mid-way.

*** I opened the SH204 and nothing "looks" strange. But I can't tell if it's
*** a SCSI or something else: it's made by Tandon in Singapore.

*** Any ideas??? BTW the 15 minute period gave me time to backup my song
*** files. So I'm OK there.

>
> If all you use your Atari for is Music, then a PC is going to be a shock.
> Atari's are physically smaller than the average PC & are far quieter

r>
r> And therefore I thought about a printer driver.
r>

Hi Berndt!

No, I fear there are no generic printer drivers for the Atari - most applications use their own, though some are shared. LaserJet 4L drivers /should/ be available for most modern software. Without knowing what your friend uses, I doubt anyone can help further.

g> problem goes away.

Sounds like a poor connection in the monitor-detect circuit - either the
lead or the plug of your SM124. Check the pin 4 connection.

2253. Horizontal sizing on an SM124 monitor

Newsgroup: comp.sys.atari.st
Date: 1997-08-21 00:00:00 UTC
From: PWest@fortress.org.uk
Message-ID: <888_PWest@fortress.org.uk>
Source record: 118122

r> Can anyone tell me how to adjust the horizontal size of an Atari
r> SM124 Monitor? My screen has been shrinking! I found the Vertical
r> adjustment but I'm not finding the horizontal.

I believe you can vary width with the core of L702, which is connected to pin 3 of the horizontal deflection coil.The other end goes to L703 which adjusts horizontal linearity (it has an 875 ohm resistor in parallel). Other end of L703 goes to + of C714 (22 microF) whose other side is grounded.

Can't tell you where they are physically on the board - this is from the circuit diagram. I'll have to find out soon, as I recently had to have a blown C (?714?) replaced and now my picture is too high giving 'tall' circles; rather than reduce height I'd prefer to increase width :-)

Regards
Peter

First try to reset the internal NVRAM.

Use RESTNVR.PRG to reset ALL in NVRAM
Use BOOTKONF.PRG to restore your normal boot parameter.

That will not work. Ask for more.

As far as the Falcon goes...forget it. ST Xformer will not work on a Falcon or anything from Mega STe and up, and even so it still wouldn't be good for anything other than transfering 8-bit files over to the ST.

Perhaps someone should ask Darek for the source code of Xformer and try to get it up to current standards. I see lots of emulators on PC's, Unix boxes and even Amigas if you can believe that! :)

2259. 520ST Ram Help

Newsgroup: comp.sys.atari.st
Date: 1997-08-21 00:00:00 UTC
From: Gene Irwin <girwin@NOSPAM.pstbbs.com>
Message-ID: <33FCFE12.6D7A@NOSPAM.pstbbs.com>
Source record: 118128

I have a 520ST, drives, monitor, etc.

It seems dead.

I opened it up and someone before me (I got it at a thrift store) had made an attempt to add another 512K to it. But, they didn't finish the job.

Is there somewhere I can get info about how to complete the task?

There are ram chips piggy backed onto the existing chips with a couple of pins lifted and the lifted pins are not connected to anything.

Where do these need to be connected?

Which pins need to be lifted? (need to verify that they did that much right)

Any info would be much appreciated.

Thanks,

Gene.

2266. Auto Folder Conflicts/Falcon/Nemesis/MultiTOS/MiNT

Newsgroup: comp.sys.atari.st
Date: 1997-08-22 00:00:00 UTC
From: csilver@kendaco.telebyte.oNmapS.com
Message-ID: <5tjdrj$m6t$1@brokaw.wa.com>
Source record: 117992

Hi Kemosabies,

Well, where to start. I have one rare Bird here. 14meg Falcon/Nemesis/NVDI/
MutiTOS/MiNT1.142/STinG1.06/CAB/PopWatch/etc.

The basic problem is that with the new STinG I can connect at 115.2k baud,
but when I add MultiTOS/MiNT to the mix I get errors ;(I suspect HSModem7
as I've had auto folder conflicts in the past with this gem (pun).

Using Peter's Serial.CPX I have these settings: modem2,protocol/115200/
8/none/1 and flow control none. I've played with other setting, but I think
these are the most significant. I've tried many setups in the auto folder,
but I can't get all of the STiK client prg's to work (PoPWatch,etc) properly
when I add MutiTOS/MiNT. Ping always works OK. If anyone has such a rare
Bird using a Falcon with MutiTOS/MiNT with Nemesis and the new STinG and
has no problems with CAB/NEWSie/PopWatch/etc please let me know :)

I can get some to work, but not all which is strange to me, but not
unexpected as Murphy's Law awaits all :) I have 20 Auto prg's plus about
20 CPX's, so I'm just asking if anyone with a similar setup has it working
at about 100% :^)

C'est la Vie

Charles

2267. Re: Monitors for Falcon

Source record: 117993

On 15 Aug 97, after being fired by Jack Tramiel, Ronald J. Hall said:

RJH> Terry, if VGA is all you want, there are a ton of monitors scattered
RJH> through -out mags like the Computer Shopper that will fit your
RJH> bill...However, if you are wanting backwards compatibility with older
RJH> TOS programs that run RGB (I mean 15khz) then it becomes a lot harder.

Yeah, ideally I'd like something that would do RGB, but realistically I know that's not likely, given my minimum requirements (15" 1280x1024 .28mm) and price range (no more than about $300). So yeah, basically I am looking at just VGA.

I know there are a ton of monitors out there that fit my bill, which is why I'm looking for recommendations, to help sort through them all. :^)

Thanks for your input.

** Stuff Deleted **

Sounds like you have an old MFM disk, & it's on the way out.

There are no longer used in PC's, but very old 8086/80286 PC's might have them. It might be possible you could find one in a junk shop or in somebody's garage sale. Should pay almost nothing for it.

This is the cheapest option.

It is also really hard to get small SCSI drives these days, the smallest are now > 1GByte.

The cost of one of these + host adapter is likely to be > $300.

How about looking for second hand items ?

>
Are you running MiNT , or anything else that might take some background time?

It might also be your floppy disks, I found a batch of 3M disks that were
supposed to be HD; I suspect they were DD. they would format with no errors,
but fail to work in both PC's & Mac's. These disks would develop 'amnesia'
after a few minutes. Memorex are sometimes poor also. Forget about Dysan.

I had an intermittent cable problem that also caused problems where the files
on the disk would become corrupted during copy operations.

>I'll buy that (even though it's irritating to think of the wasted money on
>disks that don't work), but.... during formatting everything seems fine
>(and yes, I'm formatting with "verify" on).
>Any explanation to this?

See above

>with all the information needed to do this).

>For 16MHz I'm using an oscillator instead of tapping 16MHz off the machine
>itself (just to be on the safe side).

>
I did try connecting a HD to my STFM, but I used the 16 MHx output from the shifter. It should not make any difference though, the 1772 clock does not have to be phase locked to the CPU clock. I know somebody who belw his shifter when he tapped off the 16 MHz clock.

>I've tried several HD disks, and they all give me the same problem.

>the error message the file has been copied anyway and the file size is the
>same as the original. Not sure if it's working though... (reading from disk
>is sooo slow, I thought I'd ask here before I waste any more time with it).

This is strange, because although I never got my STFM to format without errors, it was able to read PC disks reasonably well. It seemed to be a lot faster than standard DD mode.

>
>Then I opened up a new box of disks and I was able to copy the files
>without any problems.
>But the disks which gave me problems were quite new as well, though I did
>mess around a lot reformatting them etc. since I wasn't quite sure about

>damaged....

Can you get somebody to format them on a PC (or a MAC), fill them with files & then try them on the ST?

>And if they are damaged, why no error message when formatting with verify
>on?

They may be poor quality.

>(PS. the disks should be of good quality; "Sony MFD-2HDcf" all of them).

Don't be surprised if even good brands fail. If they are really good, they will have a lifetime warranty on the media.

Hi Charles,

Did you try running HSModem after MiNT? The STiK autofolder app dosen't get kicked out, but MiNT will kick out some other apps. Drivin and SCC "lay" best at the very end of the auto folder after MiNT. Yea, Yea, the docs say leave the last spot to MiNT, but that is not always the case.

From: Michael Clemmetsen <michael.clemmetsen@sunderland.ac.uk>
Message-ID: <33FD661C.85C17FE7@sunderland.ac.uk>
Source record: 117997

Hi All,

Does any one know if the Falcon implements Fast SCSI? Or put another way
does the Falcon SCSI controller use Active Termination?

My problem is that I have a Seagate ST-3655N. This drive can be set to
Fast SCSI by setting some jumpers to Active Termination. The spec sheet
says that both ends of the SCSI bus must be terminated in the same
manner. I therefore need to know what type of termination the Falcon
uses so that I can set it correctly on the drive.

Thanks for any info,

Michael

Hi,

: Does anyone know where my memory goes? On bootup (Falcon 030 running
: Magic V4 and Ease, NVDI 4) I have a respectable 2.5 Mb or thereabout
: to play with out of the 4Mb total. However as I use the system,
: mostly with CAB and during any Rez changes, I loose the RAM and it
: never comes back, well not until I reboot anyway and that takes for
: ever due, I think, to a lack of internal HD. Anyway the big mystery
: is what happens to this RAM?

I don't know about the memory, but if you want the Falcon030 boot faster
with MagiC, get the MagiC IDE Patch. It forces the computer to skip the
check for IDE drives and speeds up the boot greatly.

The patch can be found at our home page under "Software available for
download". The URL is "http://www.kuai.se/~dhedberg/".

All the best,
Daniel

Doom? Possibly the closest thing you'll get is a "game" called Bad
Mood. Trying searching for that instead.

>Third, I am looking for a few cool Falcon demos that I used to have/seen.

>actually took up 14megs of memory, according to Atari employees when I saw
>it. It was a 3D flying demo, and it was spectacular back in 1993.

That's the Moving Pixels demo, it was compiled by Moving Pixels
(Australia) for some reason or other.. looked like it might have run
in their shop or something. There are a LOT better demos available for
the Falcon, believe me. Try the Mugwumps Psychedlic Knockout, Lazers
Autowashen Verbooten (or Lost Blubb) or any of the EKO releases!
You'll find those on FTP sites.

I don't recall any demos that took up 14 Meg's of memory other than
the original Atari Slide show demos (remember all those) and thats
because the TGA slideshow program was badly programmed :-)
I can think of a few 3D Flying demos though, the earliest one was
probably the one you are thinking of by Black Scorpion Software where
you got to control this little hover craft zooming around a nice very
SNES'y MODE6 kind of landscape. Failing that there was another fractal
fly over demo with a long sampled soundtrack "Baby don't leave me!" :)
You'll find the first demo on FTP sites for sure, as for the second..
I've got it somewhere..

Cheers,

Rich

Well, DOOM was never released for the Falcon as a commercial product, but since id Software released their code onto the net a while back, Douglas Little of Black Scorpion Software has gotten a hold of it and written an id Software IWAD engine. The engine is called Bad Mood and is available at:

http://www.users.zetnet.co.uk/syardley/

The engine is not totally complete yet, but is very close. It is not a full-functioning game, but is a "demo". You can walk around and see the monsters, etc., but there really isn't any interaction yet. It's worth a download if for nothing else than to see DOOM running on you Falcon.

BTW, you'll also need to download a DOOM.WAD file for the Bad Mood engine (http://www.idsoftware.com). It's about 4M in size, so make some room on your HD!

Turn off the power, unplug the memory board and push down the ROM chip (the square thing with a brown border).

I had exactly the same problems and it should cure it. If you've got an Expose board it could be this to?

>I have a Falcon and I have been told it can emulate a 386SX.
>
>Is this true?

I don't know about a 386 emulator (I think there might have been one for the ST), but there is Falcon Speed with a 286, and I've heard a rumor that you might be able to desolder the 286 and put in a Cyrix 486. I've also seen an upgrade in a PC catalog which upgrades a 286 or 386 to a 486 without (much?) modification. BTW, that same catalog also sells Jaguar stuff! Wouldn't it be cool if we could get them to sell other Atari products? :) Just dreaming I guess... Anyway, It might be worth a look! The catalog is from a company called "Tiger Software". Their home page is: http://www.tigerdirect.com/.

a> . . . it seems Atari ST stuff is kind of hard to come by these days.

You can use any PC 3.5" drive in the Atari, either DD or HD (in the DD mode, unless you do a hardware mod). With an old ST, you may have to disconnect a small PCB placed between the Shugart bus and the drive - just plug the Shugart into the drive directly. Try the plug both ways up -it's usually the opposite way round on an Atari to a PC! And you will probably have to cut away a small area of the case to clear the eject button, though this depends on the drive used.

If you later wish to make serious use of the Atari, you would do well to upgrade with new TOS ROMs, to at least TOS 1.04 (you are likely to have 1.0 or 1.02 at present if it's a single-sided drive).

Regards
Peter

No, Njet, nada, nein... etc

As you can see from my CD ROM benchmarks page (www.muenster.de/~reschke),
there are at least two commercial drivers for ATAPI drives.

Could anyone help me with setting up Sting? (1.06)

I can connect to my provider (demon) and can ping the dialer
(127.0.0.1) and also ping my own ip address but nothing else,
infact when I try to ping the nameservers the dialer program
just crashes on me.

If I try to connect using PPP I get a crash shortly after my
dial script has just finished being processed.

I've included my: dial.src default.cfg and route.tab with this
posting so you can see if I have done something wrong.

I would love to get Sting working as it seems an excellent
program (Well done Peter, keep up the good work.)

Thanks in advance

David Knight

There is a program called Running which is for the Falcon that
is more like Duke Nuke'm based on the screenshots
on the web page. It has been released as shareware.
Do a search for it (like Falcon and Running) and you'll probably
find it easily. Hope that this helps. Anyone who has played
it, how is it?

: (127.0.0.1) and also ping my own ip address but nothing else,
: infact when I try to ping the nameservers the dialer program
: just crashes on me.

I had just this problem at first. Sting doesn't always seem to realiz
when it hasn't connected properly. In my case, the dialer never ran the
connect script portion of the dial.scr, it just dialed the number, waited
for my ISP to answer, and then announced that it was connected. I could
ping myself, but nothing else, as I was on my own network, a network which
had no other computers ;-)

I resolved the problem by using the Sting Dialer's built in scripting
tool to create a new script, rather than hand editing the sample script
the Peter included in the archive, which is how I initially tried to set
Sting up. But I looked at your dial.scr and it looks fine to me.

By the way, it seems the defaul.cfg file is not used any longer unless you
are connecting with a null modem cable. Certainly I didn't touch the copy
in the archive, it was only mentioned in the ESTABLIS.TXT file regarding
using PAP with a null modem connection.

The route.tab is exactly as mine as well. I assume you are using a
Falcon?

>
>Roger, did you get the older STing working in the end at all?

Yes, it worked (in a way), Peter, but I suspected it of introducing
data corruptions when using Newsie and CAB v2. When I changed to STiK
I did not get these corruptions.

I have got a copy of STiNG 1.06 and installed it. For some reason
Newsie tells me "DNS, cannot resolve host name" when working with
STiNG. I seem to remember this happening with the previous version but
I have not yet remembered what I did to put it right :-(

I think it is something to do with my ISP providing a dynamic address.

Any thoughts?

If your machine is an STFM then you have an RF Modulator jack on the back. If it's just an STF you need an atari RGB monitor (SC1224) or monochrome monitor (SM12x). RGB is good for games (low and mid res), mono (hi-res) is best for anything else, but both are mutually exclusive.

> 2. Floppy drive. Is the DOS in ROM? If so, how can I format a disk
> and can I read these disks on a PC or Mac?

Not DOS, TOS. TOS is The Operating System for the ST. It is in ROM, but the machine first looks for a blank floppy to boot from. If you have no floppy, the screen will stay white for a while (a few minutes), then comes up with the Desktop. From there you can format a floppy in order to boot faster next time. TOS disk format is compatible with 720K MS DOS disks.

If the screens stays blank more than 5 minutes, you have some other problem.

>
> 3. Hard drive. What does it expect? SCSI?
>

ACSI (Atari's standard). You need an ACSI/SCSI host adapter for SCSI disks. Forget IDE for the moment. You also need driver software, as this is not in ROM. AHDI is atari's and it's freeware, but outdated. HD Driver seems to be the best available, but it's commercial.

> 4. Operating system. Is it in ROM? If not, which is the best for

Many thanks for this very nice package, Peter :-)

BTW I've got some troubles.

The serial cpx hangs with Cops, though it works fine with XControl.

As someone else (Eric Hays ?) I sometimes gets two bombs and the desktop
hangs (normal tos 4.04).

I ran Cab 2.0a with ovl 1.26 and it was very slow, much more than with
gluestik.

(the last two points in ppp, I've no slip acces).

This is most probably because you took over the dial script from STiK, but
forgot to insert the DIAL_SCRIPT keyword just above the script start. Without
this keyword, the Dialer tries to read normal config variables, while the script
of course is different. Thus it gets ignored.

> DIAL.SCR file. Then I discovered the cool DIAL.SCR editing tools built

This problem is known, and soon again being worked upon. The problem is it is
very ISP dependent, so for instance I (and many other people) don't get this
problem at all (unless I encounter congested parts of Internet, that is), I
see maximum transmission speed all the time (1.6 kB a second ftp'ing a com-
pressed archive with a 14400 bps modem), which makes it quite tricky to find
out what causes the problem.

> some setting a bit off somewhere, but don't know enough about MTU's and
> what'nots to figure that out. Also, disconnecting refuses to hang up my
> modem, even though ATZ always worked in my STik defaults, and trying ATZ
> or the default ,+++,ATZ in the Sting dial.scr both failed to do the trick.

You can try to use DTR as the hangup string. This setting causes the Dialer
to drop the DTR line, which at least should hang up the modem, unless you
have a *very* strange (or ancient ?) one.

> Oh, and exiting the dialer Geneva warns me that the program terminated
> with a status of -1, meaning it didn't quite quit cleanly. This warning
> is a feature of Geneva and won't show up under normal TOS, although
> apparently the problem still exists, just unseen.

It is not at all a problem. In some way, you can say Geneva is at fault,
because these return values do not make sense for GEM applications. They're
there for .TTP's that are going to be called in scripts, thus their return
value would indicate some status. The return value of a GEM application
however has no meaning, so Geneva should not complain about any value
'returned' by a GEM application. Indeed the Dialer's main function is
declared as 'void', so there is no return value at all.

> Now on to my real problem. I tried to get PPP without any success.

I might know what caused the bombs. But it's tricky to solve so I can't just
do it and send out the fixed version. I suggest you send me a mail in a couple
of days, I guess I fixed the problem I think of until then. The problem would
appear if the ISP tries to negotiate an excessively long list of options.

Cheers Peter

I'm 100% sure the Dialer didn't know about the script part, probably again
because the DIAL_SCRIPT keyword was missing. Check out the Config section,
the Dial Script page. It's not there is it ?

It does not work to simply use the DIAL.SCR you used to use with STiK, with
STinG's Dialer too. There are a few differences, you'll have no way to miss
them if you read the sample DIAL.SCR, and follow the instructions.

> By the way, it seems the defaul.cfg file is not used any longer unless you
> are connecting with a null modem cable. Certainly I didn't touch the copy
> in the archive, it was only mentioned in the ESTABLIS.TXT file regarding
> using PAP with a null modem connection.

The DEFAULT.CFG is a means to set variables that have global influence, i.e.
concern more than one port. The Dialer cares only about the variables specific
to the port a connection is to be built with. The name DEFAULT.CFG does not
really suggest this, but it is of historic origin (STiK).

I thought it was pretty cool. I just wish it would take advantage of my Nemesis.

I'm not much of a games player, but even just the one level demo was entertainingly challenging to me. The graphics and interface were good, although I expect Bad Mood to be quite a bit more when it ever is finished.

>The route.tab is exactly as mine as well. I assume you are using a Falcon?

I have the new STinG working on a SLIP account at 115.2k (ppp on Mon/Tues).
Other than some obvious Auto folder conflicts, this might help a bit:

If your sting.inf file looks like this C:\STING\ then I put all of these
files in that folder: dialer.app, dialer.inf, dial.rsc, dial.scr, default.cfg,
cache.dns, resolve.stx, serial.stx, tcp.stx, udp.stx, route.tab. (all in the
main directory) If STinG is having problems finding your dial/default this
should work. I'm not sure what you mean that the default.cfg isn't needed,
it sure is for a slip connection...

Auto folder prg's, last few files are: nvdi,drvin,scc,sting.

As I previously posted, the only problem I'm having is getting everything
working using MultiTOS/MiNT. MultiTOS ain't Geneva or MagiC, but should
work. I doubt if Peter has tried his prg's/app's with it as few people use
MultiTOS these days =)

Havin' fun yet?

Charles

2306. FS/T: Atari ST software [08/23/97]

Newsgroup: comp.sys.atari.st
Date: 1997-08-23 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <34062a39.1054065@nntp.ix.netcom.com>
Source record: 118024

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 08/23/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped!]:
$ 5.50 Arkanoid (Taito)
$ 5.50 Art & Film Director (Epyx) -- $4 shipping, due to weight,
counts as 1st item
$ 4.50 Battleship (Epyx)
$ 2.50 Bobo (Infogrames / Terrific Software)
$ 4.50 California Games (Epyx)
$ 4.50 Championship Wrestling (Epyx)
$ 2.50 Crash Garrett (Metal Hurlant)
$ 4.50 Death Sword (Epyx)
$ 3.50 Devon Aire (Epyx)
$ 3.50 Dive Bomber (U.S. Gold / Epyx)
$ 2.50 Dragon Scape (Free Spirit)
$ 3.50 Final Assault (Epyx)
$ 4.50 GFL Football (Gamestar)
$ 3.50 Golden Path (Firebird)
$ 3.50 Goldrunner II (MicroDeal)
$ 4.50 Impossible Mission 2 (Epyx)
$ 4.50 Karateka (Br0derbund)
$ 3.50 Knight Orc (Rainbird)
$ 4.50 L.E.D. Storm (Capcom)
$ 3.50 Lands of Havoc (Antic Software)

$ 4.50 Last Duel (Capcom)
$ 4.50 Man Hunter: New York (Sierra)
$ 2.50 Mean 18 Famous Course Disk Volume II (Accolade)
$ 4.50 Metro Cross (U.S. Gold / Epyx)
$ 4.50 Paint Pro (Abacus Software)
$ 3.50 Prime TIme (First Row)
$ 4.50 Quadralien (Spinnaker)
$ 4.50 Renegade (Taito)
$ 4.50 Space Quest: Chapter I (Sierra)
$ 3.50 Star Quake (Terrific Software)
$ 3.50 Star Ray (Logotron)
$ 6.50 Star Wars (Br0derbund)
$ 3.50 Stunt Track Racer (Microplay)
$ 3.50 SwiftaR (Accustar)
$ 4.50 Techno Cop (U.S. Gold / Epyx)
$ 4.50 The Advanced OCP Art Studio (Rainbird)
$ 4.50 The Games (Epyx)
$ 3.50 The Pawn (Rainbird)
$ 3.50 The Sentry (Firebird)
$ 5.50 Tower Toppler (U.S. Gold / Epyx)

$ 4.50 World Karate Championship (Epyx)
$ 3.50 Zero Gravity (MicroDeal)
$ 3.50 Zynaps (Hewson)

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3 for the first game and $1.25 for each additional game, unless otherwise listed. If you order enough items I can weigh the order as a package, which might reduce the shipping costs. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address (this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

2309. TOS2WIN

Newsgroup: comp.sys.atari.st
Date: 1997-08-23 00:00:00 UTC
From: guy@swampdog.demon.co.uk
Message-ID: <33ff328e.260699@news.demon.co.uk>
Source record: 118027

Hi folks,

Firstly, is there an english demo of tos2win, does the full version
come in english, and secondly, does the blighter run magic? I bet it
doesn't 'cos I like it! ;-|

For anybody thinking about buying a PC ...

Don't. Go on holiday instead. Or buy lots of beer and give it away.
Alternatively, if you're not into holidays and not feeling
particularly generous just set light to all. It'll be more fun, really
it will!

[moan mode on]
I'm now firmly convinced windoze 95 is the date the accidentally
released joke operating system was programmed to expire.

```
void windoze95(long intentional_startup_delay)
{int (*fcp)(); /* someone never realised it should be void */

wait(long_intentional_startup_delay);
fcp = rand();
if (fcp & 8) (*fcp)();
else alert("general protection fault");
}
static char dummy[(int256)BLOATVALUE];
```

I ask you ...

I need Turnpike to dial because '95 won't.

The rest of Turnpike blew up decrementally.

'95 won't shutdown after Communicator has run.

Office hangs if I do anything email related. No worries, it'll expire
soon as well. I have to admit to liking the paper clip though!

Publisher let me spend ages designing a groovy web site without
bothering to tell me all the sodding pages have to be the same size -
only the first page is supposed to have a red background, and no, it
never told me it was converting some text to images and now the source
has vanished cos I copied it all to another folder "just in case the
worst happened" (exploring) then decided I was being too paranoid and
deleted it with the file manager. Only exploring doesn't always copy
does it, it moves on the same drive.

Eudora crashes a lot so has made itself at home very quickly.

NT won't. All I've accomplished is a dual boot with a useless option (perhaps not, it does manage to get the business of locking the machine up accomplished much quicker than '95). This official microsoft "virus" refuses to be got rid of.

When I want a task killed I don't need '95 telling me it won't respond. I know that. If it did respond I'd quit it normally.

Is there an inbuilt "concentration breaking algorithm"? Just what does '95 think its doing faffing around with the hard disk half an hour after I launch the compiler. Not only does it always do this, it does it badly, interfering with keystrokes. It reminds me of those scenes in films where the nutters are wandering about aimlessly picking things up and putting them down again. It does it to no other process as badly as to the compiler.
[moan mode off]

Hey, I just thought of another thing you could do with the money. Test your friends ...

Number each sheet of toilet paper and note how much each of your friends use. Now replace the loo roll with the money. Beware the ones who come out walking funny and have to leave quick - they must be really greedy! <G>

Give me an auto folder or accessory conflict to sort out any day!

2310. New STinG

Newsgroup: comp.sys.atari.st
Date: 1997-08-23 00:00:00 UTC
From: pmorales@primenet.com
Message-ID: <5tndi4$mqc@nntp02.primenet.com>
Source record: 118028

Oh well, may as well get in on the action.

I've spend a bit of time with the new STinG and thought I'd share my results. First off, I'm using Geneva and NeoDesk on a TT and use HSModem v7 on the Ser.2/LAN port at 115,200. I have been using STiK quite successfully for a while and that means that my compression flag has been turned off for my SLIP connection by my provider.

STinG SLIP: Works, but not as well as STiK. The dialer works great, and I get a connection with no problems. I load CAB and the DNS resolve is fast, data starts moving then many hangs occur. The page will complete but it generally takes a long time, much longer than using STiK on the same page.

STinG PPP: Not so good, here. The dialer works great and I achieve a PPP connection. I can load CAB, select a URL and then I'm done. It's lockup time and no modem activity appears to be happening.

Okay, time for questions: If my provider has turned off my compression flag (which is the case), does that mean PPP will not work? Also, should the VJ compression be turned ON in the STinG configuration setting or is this setting only applicable to SLIP?

I'll keep trying and I appreciate all the effort and support that has gone into making this happen. Thanks a bunch, Peter!

From: pmorales@primenet.com
Message-ID: <5tngnc$nuh@nntp02.primenet.com>
Source record: 118030

Okay, I tried a bit more and found out that removing the $GET_IP string from the DIAL.SCR made a big difference in modem activity. I still hang at RESOLVE, and eventually crash, but the activity is promising.

Or is it?

What's the correct way to set up the login in DIAL.SCR?

Oh, and can we learn a bit more about PAP and how do we find out if we need it. Time to call our ISPs?

Thanks!

>problem at all.

Unfortunately, ASH not translating their best softwares,
nor their programing docs to english will probably mean
fewer users supporting them, even though they could gain
more customers in non-german speaking countries....

My personal quible involves Papillion, which is neither
translated, nor distributed outside Germany, even though
it's possibly the best bitmap drawing software out there.

While I could still get by with the original German version
(and I would probably take the opportunity to translate the
resource file to English), the fact remains I cannot order
it through regular sources, simply because ASH doesn't care
about the foreign market. Their attitude seems to be:

"Good stuff was translated by System Solutions.
If they haven't bothered, neither will we."

I have even mailed ASH on several occasions, offering to
translate Papillion, without any reply beyond a standard

"English versions if/when available through SysSol."

Unfortunately the SLM804 needs to be powered up (using juice and making noise all the while) otherwise unplugged from the system. Tried it in all possible permutations and that is the best I can come up with. Have a spare Atari ST and monitor to drive it, over in another corner of my office, but still it would be nice to have the whole works connected as as an expandable monster system :(

There is actually a _real_ DOOM for the Falcon floating around on the net,
DEE. Someone disassembled and ported the NeXT version.

This is _very_ slow unless you have an AB040, though, and it is of course
a quite illegal port. Some time ago there was supposed to be a Web site
were you could find it, but I don't know if that's still around.

>Well, DOOM was never released for the Falcon as a commercial product, but
>since id Software released their code onto the net a while back, Douglas

The source code for DOOM has not been released.
You might be confusing it with Wolf3D, for which the sources were indeed
released or Quake, for which they were stolen.

>Little of Black Scorpion Software has gotten a hold of it and written an
>id Software IWAD engine. The engine is called Bad Mood and is available

Doug Little is part of the BAD MOOD development team, which started out
two years ago with the goal of making a DOOM clone for the Falcon.
Due to his experience in 3D and DSP programming, Doug has written most
of the current engine.

The base for our work was a non-textured WAD viewer, DVIEW, written for
PCs in C++ by a guy named Jake Hill. It's of course rather difficult to
see the similiarities between the current 100% assembler engine and the
orignal, though.

My original port and optimization (in C) of DVIEW is available on the
main BAD MOOD site (the place where the mailing lists are run from and
archived). There are version that run on both STs and TTs.

In a couple of hours the latest version of BAD MOOD (v3.07beta) will
be available on the same site (I always lag behind for no good reason).

http://rand.thn.htu.se

>The engine is not totally complete yet, but is very close. It is not a

Yes, v3.07 is indeed very much like the original, graphically.

>monsters, etc., but there really isn't any interaction yet. It's worth a
>download if for nothing else than to see DOOM running on you Falcon.

It looks a lot better than the original too. ;-)

If anyone's interested in helping out, please join the BAD MOOD team.
The engine is mostly done, but there are lots of things left to do, for
example WADs, graphics and AI. We're going to use something similar to
Quake's modules for the AI, once I get the interface code written.
(We'll rely on ordinary compilers rather than interpreting pseudo-code.)

Hello Regis-
My setup is 1040STe-LINK 2-Seagate ST1096N-EZFlyer230 (self-terminated)

I use a special cable that links the Seagate to the smaller EZFlyer
connector. There may be a problem with that connector.

Is it safe to turn the EZFlyer on with no cartridge inserted?

I'm still working on the problem but I'm baffled b y the fact that
some programs (Diamond Edge, MBrowse)work fine on the EZFlyer but
others (Diamond Back, Protext, LDW Power) do not and get different
check sums from the original after being copied.

When I get this problem resolved I'll post the "answer" here. I've
had several helpful suggestions, mostly dealing with proper termination.

```
: If I then ping my Nameserver I can get 50 packets sent, 50 received...
: Anything else is a bust. One thing for sure, If you can't ping your
: nameserver your dead!. With this jumble all STiK clients work "el speedo"
: using a 115.2k baud connect. 19.2k baud ain't as picky :) I'm leaving out
: some other strange stuff like Fast_Serial.CPX working with STinG, but the
: Serial.CPX is what I'm using now. Anyway, I can't add MultiTOS to this mix
: yet as I'm running out of the 20 x 2nd power combinations of Auto folder

If you run multi-tos anyway...why mess with STinG? No offense to STinG
teamsters...but there's no need for it with Multi-Tos! My understanding
is the call for STinG and STik was to address low memory Single-Tasking
systems that can not run mint due to memory constraints. I haven't
investigated STinG yet, but I know for a fact that STik does NOT work
under MultiTos at all, and I suspect that similar would be true of STinG.

If you use Multi-Tos, then you are already using Mint!
So, why not simply install the socket and slip devices (known as
"mint-net") and use that? All this requires is that you place two files
in your Mint/MultiTos folder, and they'll be loaded!

Next, you simply need a pppd or slattach program, which simply dials
your modem, and pipes the data to the TCP/IP stack, and a few other basic
tools that you can either set up as a TTP program from your desk-top, or
run from a TOS window, or even the console itself.

Finally, you just need to figure out what config files your compilation of
mint net needs, and where it expects to find them. If you don't want to
mess with a minix partion this is fine, just use the sln commands in your
mint-cnf file to make "virtual" links to your paths.
An example of these config files:
.ppprc
This will simply set your baud rate, and then grab the info from
your .chat file, which logs you in to your provider. PPP bascially sets
itself up, so the only other thing you "should" have to set is the MTU,
and in a lot of cases this is automatic as well.

.chat
See above.

.domain
This will be your nameserver....a 2 line text file.

And so on...there will be other similar files to lock in various
variables. Different versions of mint-net will hunt for things in
different places, depending on who compiled it! Hopefuly, if they went by
unix rules (what little I know of them), it will scan all the directories
```

in your "PATH" setting till it finds what it's looking for.

There is a PPPkit in existance that one can study to find out where mint-net looks for its files, and you wouldn't have to dedicate a minix partition. A good place to start is by installing this package by the directions, and changing the line INIT=OLDGEM.PRG to INIT=GEM.SYS.

Now, if you want to run STik/STinG clients...just add two more lines to your mint.cnf file, which simply launch two programs of a package called glue-stik.

Oh well, good luck folx...

>> smaller code in less time than gcc. It seems this is because gcc is

PureC is certainly a _lot_ quicker than gcc, but there are of course reasons
for that...

There is no question, however, that gcc is _far_ better at optimizing, but
for simple code PureC can be as good or perhaps even slightly better.
For more complex stuff, gcc compiled code can well be 5-10 times faster,
but it depends a lot on what you're doing and how you're doing it.
(For one of my image processing routines in MGIF (which wasn't written to
take advantage of any special compiler) the difference was about 6 times.)

PureC is good at allocating registers and the register based calling
convention can also be a bonus. Apart from that, it doesn't seem to do
much (if any) optimization at all.

Some time ago, I wrote a Usenet article (on c.s.a.programmer, I believe)
comparing gcc, Lattice C and PureC on the following relatively simple
piece of code.
It should be reasonably easy to find that article on dejanews, but in short
PureC was pathetic in comparison to both gcc and Lattice C.

```
#define ROWS 25
#define COLS 25

void main(void)
{
long i, j, k;
long array[ROWS][COLS];

for(i = 0; i < ROWS * COLS; i++)
*((long *)array + i) = 0;

k = COLS * ROWS;
for(i = 0; i < ROWS; i++)
for(j = 0; j < COLS; j++)
```

```
array[i][j] += i * k;
}
```

>> portable and gives away loads of speed to test the plattform it is

The portability of gcc causes much of its slowness, but it also allows
compiler experts all over the world to contribute to it. Naturally, the
result is a compiler that is very good at general optimization.

Earlier gcc was supposedly the best compiler even in the Intel world, but
I think the Pentium and recent Visual C++ versions might have changed that.
On the other hand a new gcc version with Pentium support is on the way.

If someone took the time, the 68k gcc code generator could be improved, but
I doubt if we'll see that happen.

>I doubt that. Johan? ;-)

I wouldn't miss one of these compiler comparisons for the world. ;-)

>Pure C compiles the code and that's basicly it.

Yes, it looks that way.

From: denr@denr.demon.co.uk
Message-ID: <872446228_OASIS_@denr.demon.co.uk>
Source record: 117949

My current system comprises:

ATARI 1040STFM upgraded to TOS v1.4 with 4meg RAM a Mono Monitor and
connected to a Hard Drive plus ZIP Drive via LINK'97.

I recently obtained an ATARI 1040STFM TOS v1.02 with 4 meg RAM and a
Philips CM8833 Colour Monitor.

Is it possible to connect the STFM's in such a way as to "share" the Hard & ZIP
Drives and if so, HOW??, and would I have to upgrade my second machine.

I know this subject has been discussed on "comp.sys.atari.st" previously,
but, I can't "save" or "hardcopy" everything!!

Ta for anything that may help.

Out of the ether, the following was mentioned by bdc2@po.CWRU.Edu...:

b> so it doesn't sound like a Nova. The only identifier I could find
b> was on
b> a teensy piggyback board with one chip, labeled "matrix". It was
b> originally
Sounds like it could be a Matrix TC1208e VME graphics card with the optional
video digitizer plugged in on top.

Does it have a big chip on the main VME card near to the backplane that is
made by Texas Instruments and loads of RAM chips towards the other end?

b> screen for photo work. If I can, I want to use it for 256 color (or
b> higher) with a NCR 17" SVGA.
Well if it is the TC1208e it works upto 1280x1024 in 256 colours or lower
resolutions with more colours (upto 16million in 832x???).

b> Does anyone recognize it from this description? If so I haven't
b> been able to get it to work at all, since I can't identify the
b> driver, and how to init it. Do you know the name of it's proggie?
Well I have the driver disks which come with the Matrix TC1208e,
though I use the special NVDI version for this card but that is
commercial software.

If you can identify a big copper topped chip on the main board made by Texas
Instruments and want copies of the original driver disks let me know.

Spencer

```
For Sale:
---------
* 4160 STE (TOS 1.62, 4 Mb) ==>> ie: 1040 STE @ 4 Mb

* MEGA-ST 4 (TOS 1.04, 4 Mb)

* MEGAFILE 60

* SLM 804

* STM 1 Mouse

* Various DTP and Music softwares

Offers within Canada / US only! Will sell to best offer, or trade
(individual items or whole package) for either of the following:

* MEGA-STE (TOS 2.06, 4Mb Ram, Internal HD)

* STacy 4 (TOS 1.04, 4Mb Ram, Internal HD).

* Crazydots-2 graphic card for TT (or equivalent ET-4000 card)

NOTE: Nothing against our friendly neighbors from down south.
However, Canadian banks often cause troubles for cashing
foreign currency of any kind, including American.

Nonetheless, if you're interrested in trading your MEGA-STE
or your STacy, we can arrange something, as no money would
be trading hands through this deal.

More details and other items I'm selling or looking for on my page.

Try

http://www.coollist.com/menu.htm

They offer a FREE listservice, you can set up a mailing list, and
add, delete users ect all from a web page (all password protected ect)

The way its free is that it adds a Max! 4 line advert to every post..

I set up a mailing list in about 2 minutes.. unfortunatly I had
problems.....but then I had a LOT of people join.. It may work better
for a smaller list?.. anyway its free and may be worth looking at, but
I emphasise "may" :)

.

The new version of Sting seems to work OK with Newsie, but not with CAB.
It is soooooo slooooooow. I changed from CAB.OVL 1.2618 and started using 1.25.
This is better, but much too slow to be useable. (I'm using a SLIP connection)

I've tried adjusting the value of MTU from 576 to 1500; it seems to make no
difference.

Have others been having this problem? Any suggestions?

John

I wasn't refering to an Atari search engine. Any web search engine will do... try
http://www.altavista.digital.com or http://www.yahoo.com (as soon as you get
your WWW setup running!)

> Is there anyone out there who has already made the connections or who know what they
> are?
>

It's quite simple once you have the pinouts. The monitor is RGB, and so are the
connections on the ST :

Monitor Port (as seen from the back of the ST)

01 02 03 04
05 06 07 08
09 10 11 12
13

Pin Use
01 Audio out
02 Composite video
03 General purpose output
04 Monochrome detect
05 Audio in
06 Green
07 Red
08 Peritel power
09 Horizontal sync
10 Blue
11 Monochrome
12 Vertical sync
13 Ground

Sorry, I haven't got the Peritel Scart pinouts on hand, but you can probably find them quite easily, even offline (maybe your TV set's user manual even has them).

There is another solution, just use Everest and set it to save using
LF instead of CR/LF (under miscellaneous parameters) or vica versa to
convert the other way.

2337. RAM types...

Newsgroup: comp.sys.atari.st
Date: 1997-08-25 00:00:00 UTC
From: "Jon Hull (CS)" <hull@eng.usf.edu>
Message-ID: <Pine.GSO.3.96.970825163849.8020A-100000@suntan>
Source record: 117963

I am looking to upgrade my Falcon. I have 4 megs of RAM in it right now (the original board), but I want to upgrade it to 8 megs, and eventually 14 or 16. A friend of mine has given me two sets of SIMMs:

1. 8 megs = 8 x 1 meg boards. No parity. 30-pin. 3 chips (1 meg chip + 2 "controller chips") per board. 70 nanoseconds.

2. 16 megs = 2 x 8 meg boards. No parity. 72-pin. 8 chips (1 meg each) per board. 60 nanoseconds.

Can I use either of these sets in my Falcon, and if so, which RAM upgrade do I need (FalconWing, etc.)? Any help would be greatly appreciated.

Well I've solved the crashing problems now. It seems Sting must come
after hsmodem in the auto folder (unlike stiktsr) I reordered my auto
folder and I can now ping my nameservers and connect using PPP.

I can even resolve hostnames although this takes far too long to do
so I obviously haven't got everything set up right, I still can't
receive any data though.

That explains why it recognised keys others have problems with. Most
notably is the backslash \

Have I missed a site with english docs and an english resource?

In the best of all possible worlds I'm after an emulator that emulates
everything atari! :-)

As that's expecting a bit too much, I need an emulator that can run
the MWC compiler. There's a caveat though - it also has to run MagiC.

[as I had a real rant about '95 here's some balance] ...

I tried Pacifist first. Pretty good but has keyboard problems and will
not run the MWC command shell (it will but the shell cant see some
files). For those who don't know, this is first and foremost a games
emulator. Thus for me to get as far as I did is all credit to the
author! Back to the plot ...

This is understandable when you read the docs. aiui, the hd emulation
is at gemdos level and the floppy emulation is at bios level. The MWC
command shell uses bios commands. I dunno which but it certainly uses
GetBPB() for instance. It runs fine off a floppy image but not off an
hd one. The largest working floppy image I've got to work so far is
3Mb.

The Gemulator demo (the one that runs magic) has keyboard problems as
well. These would appear to be mapping problems. There is also a
problem with magic versions which posess their own file selector. When
a folder is selected it tries to open it as a file. I'm told this is
fixable by using installing a replacement file selector. MagiC 2, not

having its own, works ok. The stumbling block here for me, is that the demo refused to look at magx.inf, without which my MWC shell cannot realistically be used.

The Magic_pc demo (naturally I guess) works best. Unfortunately, it also has keyboard problems - I just hope someone can tell me that these are just mapping problems also, and an english version would not suffer from them. It runs NVDI 3 to some extent, system fonts install but vectors seem to be ignored (but no english docs remember). My version of Ease seemed to be rather good at corrupting stuff as well - directories and the like. Neither of these, I assume, is really a problem because system solutions do a bundled magic_pc/nvdi/ease package - the supplied magxdesk worked fine, though unless I'd used magic before I wouldn't have known which thing meant what. Rather, I would take this to be a compliment on how good the emulation is. The fact that nvdi worked at all amazed me. However, even so, the emulator seems a tad slow. In my own case, I prefer this to "reduced emulation" although I would soon change my mind if my processor was not a P2!

I emailed system solutions over the weekend asking about an upgrade path from my ST versions to magic_pc. Will let you all know when they reply. Hopefully, it will be good news!

Use GZIP on it. If you end up with a filename called just "file" then rename it to "file.tos".

Hi,

I think that the easiest solution would be to network the
two STFM machines together thus allowing them to share drives.
You will find on many FTP sites a program called DUET. This
allows you to network two Atari machines together via the
MIDI or Serial ports of the two machines and share drives.

Regards,

Ben Hills.

A lot of strange things can happen with improperly terminated SCSI
chains. If errors occur or not may even depend on your hard disk driver.
Drivers like CBHD or HDDRIVER 7 are target-controlled and check more
signals on the bus than other drivers do. On the one hand this can lead
to more security, on the other hand these drivers are quite sensitive to
bad cables etc.
But anyway you have to ensure that the termination is OK and the cables
are good and if this applies any driver works correctly. Most SCSI
problems we encounter in this and other newsgroups are due to wrong
termination.

Hi Brian,

Well, thanks for the very informative post. I haven't been able to get MultiTOS/MiNT to work with STinG, but I CAN/HAVE been running it OK with STiK for some time now. Maybe I'm the One an Only :) For informative purposes here's the conf's:

```
#gem.cfg
-----------
setenv PATH=.,C:\
setenv ACCPATH=C:\
setenv ACCEXT=ACC,ACX
setenv GEMEXT=PRG,APP,GTP
setenv TOSEXT=TOS,TTP
setenv SHSHOW=O:\MULTITOS\VIEWER.APP
setenv SHPRINT=O:\MULTITOS\LPR.APP
setenv TOSRUN=O:\MULTITOS\MINIWIN.APP
```

```
# multitos.cnf
-----------------
# Start up the GEM Desktop
GEM=C:\MULTITOS\GEM.SYS
# to run gluestick if all else fails :)
#exec c:\e\gluestick\gsdaemon.prg
#exec c:\e\gluestick\gsdriver.exe
```

As you can see it's very basic/old stuff. In the Auto folder is mintnm (version 1.142). I have memory protection turned off as you can see. Maybe this is what knocks off STinG... All in all this works very well for almost all prg's and app's. One shouldn't be deceived though, on a stock Falcon, MultiTOS/MiNT is as slow as Molasses. Nemesis/NVDI moves!

>If you use Multi-Tos, then you are already using Mint!
>So, why not simply install the socket and slip devices (known as

Until now, I didn't have a ppp account and I couldn't find a chat file to
connect with SLIP, everything demonstrated was ppp... If I can't get
STinG to work with ppp, I'll have to give this a go/go... I never did see
a reason for me to setup a minix partition, convert to THING, and use a
UNIX editor in order to get really good MiNT/MiNTNet conversion. I'm
happy with what I have thanks to the Nemesis/NVDI upgrade. I just want a
faster access to the Net with a ppp/56k modem connect :)

Bonjour Pascal,

Nice try :) I assume your using HS7 as STinG doesn't work with Fast_Serial.
If you load FS, the STinG.CPX only goes to 19.2k. If you try 150(? what-
ever the 115.2K equivalent baud) FS chokes as invalid...

That's because STinG wrongfully requires HS-Modem's cookie
to offer higher speeds, even on M-STE/TT/Falcon. However,
Peter's new CPX (available separately from STinG too) does
fix this and has finally allowed me to upgrade to HS-Modem
and put Fast_Serial to rest.

One way to somehow fool STinG might be to use the RSVX.PRG
that comes with HSMINST, (a MiNT tool to correctly install
the HS-Modem drivers under MiNT) to simply insert a cookie
well enough to fool STinG.

Still, I can vouch for Peter's new CPX, as it allowed me to
finally get HS-Modem to work correctly on my TT.

2352. Oasis and N.AES/MiNT/MiNTnet?

Newsgroup: comp.sys.atari.st
Date: 1997-08-27 00:00:00 UTC
From: Martin.Byttebier@ping.be
Message-ID: <872713606_OASIS_@ping.be>
Source record: 117883

Hi,

Despite some bugs in Oasis 1.35 I do love to use it. My problem is
that I can't use it online under N.AES/MiNT/MiNTnet. Oasis refuse to
dial.
After the dial command I get the following on the screen:

dialing on pp0
input line: cwait 4000 "ok"
Dial pp0 complet

What is the problem here?

Hi, yes there is a port of GOPHER for atari st.
Works great and fast.
(however, only mintnet AFAIK :))
where you culd get it? hmm I think I got mine on cnam at the time, but
you could try ftp.lip6.fr or ftp.funet.fi in mint directory.
Bye. Happy gophering.

I have had a SH204 shoebox drive since the late 1980's. I thought that
all
the SH204's used MLM disks. The feed from the back of the ST is
supposedly
ASCI (or somthing like that), and the first board in the SH204 turns it
into
SCSI--then that feeds into an Adaptec 1000 disk controller that
translates
it to MLM. I replaced the 20 meg mechanism with a Seagate 251-N that is
a 40 meg MLM drive. (If I am mixed up about any of this, someone please
post and correct me.)

2358. STiK/STinG

Newsgroup: comp.sys.atari.st
Date: 1997-08-27 00:00:00 UTC
From: leaver@netinfo.com.au
Message-ID: <5u0dqb$1mj@maserocki.netinfo.com.au>
Source record: 117889

I have the fortune, good or otherwise, to use an ISP which may be familiar to you, because it is the one attached to Steve Adam's name in all the doco. That ISP appears to have a few peculiarities which cause me to be amazed that Steve ever got STiK working at all.

First MTU = 252 seems to be an absolute limit with SLIP. Anything above that and performance collapses - packets of 26 bytes come through at the rate of about 1 @ minute if I'm lucky. However, with 252, CAB and STiK v 1.12 work very well, with one exception. There are certain addresses from which I seem to be barred. The URL is resolved all right, but no data ever arrives. This black list is not large, but it includes Flinny's and the Atari Computing site.

Antmail has always worked well (subject to MTU = 252). Older versions of Newsie were fine with UseNet but tended to go into spasm, with much modem activity but no progress when reading mail. I haven't much experience with v0.79 but it appears ok so far. FTP has always been a black hole - maybe this verion of Newsie will fix that.

STinG/SLIP is still subject to the same MTU behaviour as STiK. The good news is that I can now get to Flinny's site. The bad is that I suffer from what Peter says is a bug preventing rapid recovery after a packet gets lost or corrupted. A file starts to arrive at good speed but, if there is a glitch, retrieval slows to a crawl. Behaviour is very random.

PPP is still a no-no. The logon dialogue for PPP differs form that for SLIP in that my ISP does not transmit a CLIENT_IP, at least not in plain text. After the dialler has transmitted my password the modem gets very excited on both send and receive, but nothing gets resolved.

Two little quirks I have observed - Peter suggested that I include a CLIENT_IP = 0.0.0.0 line in my script to force STinG to negotiate an IP. I have done so, but the dialler still shows 127.0.0.1. If rather than dialling, I open the port cpx and set my modem port (Ser.2/Lan) to active on PPP, the modem gets very excited (although it's not connected to the outside world) and a second ot two later, crash.

2359. SDK cd-rom

Newsgroup: comp.sys.atari.st
Date: 1997-08-27 00:00:00 UTC
From: leaver@netinfo.com.au
Message-ID: <5u0dqe$1mj@maserocki.netinfo.com.au>
Source record: 117890

I have purchased the Software Development Kit cd-rom from 16/32 Systems (UK). Unfortunately I am having trouble reading it. I can access only three of the folders in the root directory. However those folders are fine - programs in them will load and run.

My drive is a Sony CDU415 connected to my Mega STe via Link 97. I don't possess many roms, but this has been the only one in my experience to cause trouble. However my neighbour's Windows beast reads it happily, so there is obviously some incompatibility between my drive and the disc.

Does anyone have any advice on reading recalcitrant roms? (While 16/32 Systems were very prompt in sending me the disc in the first place, they have ignored two subsequent requests by e-mail for advice/help)

2361. Canon BJ200EX with NVDI 4

Newsgroup: comp.sys.atari.st
Date: 1997-08-27 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <97239.201612STIRRE31@MAINE.MAINE.EDU>
Source record: 117892

If someone is using this printer successfully with their
NVDI setup, please let me know how. The Canon BJ-10 driver
will print fine under CAB but not under AtariWorks (it does
not seem to recognize the right margin and text is cut).
Since it works with CAB could it be a problem with
AtariWorks? I have always had problems with setting
up NVDI to print correctly with AtariWorks. SpeedoGDOS, however,
always printed beautifully.
Perhaps it is AtariWorks? If so, can anyone recommend a patch
or a different word processor? One that works modern
printers. Thanks.

2368. STinG/Dynamic IP Resolve Problem

Newsgroup: comp.sys.atari.st
Date: 1997-08-28 00:00:00 UTC
From: csilver@kendaco.telebyte.oNmapS.com
Message-ID: <5u4qi2djt1@brokaw.wa.com>
Source record: 117832

Hi All,

I think I can see from several posts here that some can't get a dynamic IP address using the dial.scr with STinG. I'm having the same problem ;(Basically, my ISP knows by your login name and Password what kind of account you have and immediately sends a ppp packet after login. If you have a Static IP, as I do with my SLIP acc., there's no problem. Otherwise, a FIND statement like "Your IP address is" or any other wording doesn't work, as there is nothing there to capture! If you use a terminal prg to look at the login sequence, that's what you'll see. Your assigned IP is never mentioned. It's included in that cryptic ppp packet.

I'm not sure there is an answer to this one other than changing ISP's. I may be missing something here, but if anyone has better info, let me know :)

Static SLIPping only,

Charles

Hi David,

in a message dated 27 Aug 97 David Leaver wrote:

DL> PPP is still a no-no. The logon dialogue for PPP differs form that
DL> for SLIP in that my ISP does not transmit a CLIENT_IP, at least not
DL> in plain text. After the dialler has transmitted my password the
DL> modem gets very excited on both send and receive, but nothing gets
DL> resolved.

Do you have something like this in the dial.scr:

```
#
WAIT = 500
REPT =
FIND = Your IP address is
RESP = $GET_IP
#
```

I thought first it was not needed cause it is not for Nos nor MintNet.
In fact it is needed and then Sting works. I've just try the internal tools
(ping, resolve) and Cab. The later is much slower than with MintNet but it
works. BTW I didn't made a change to the included parameters (allocmem, ...)
exept for the mtu (my ISP "says" it is 1500 in StarCall) and of course my
personal details.

I should perhaps increase allocmem ?

DL> Two little quirks I have observed - Peter suggested that I include a
DL> CLIENT_IP = 0.0.0.0 line in my script to force STinG to negotiate an
DL> IP. I have done so, but the dialler still shows 127.0.0.1. If
DL> rather than dialling, I open the port cpx and set my modem port
DL> (Ser.2/Lan) to active on PPP, the modem gets very excited (although
DL> it's not connected to the outside world) and a second ot two later,
DL> crash.

I also have two bombs sometimes and have to reboot after that. It seems it
is a few seconds after closing one of the CPXs and/or after a successful run
and of the dialer (without dialing, bombs come up to qwickly).

Bye David,
/Pascal/

In article <3400da4e4944f94@post1.com>
hall@post1.com (Hallvard Tangeraas) said:-

>Anyway, with the "Thing" desktop/MagiC I've encountered a problem. The
>files converted end up in the "unix2st" directory and are given the
>names "RBS10000" "RBS10001 etc.

The RBSxxxxx files are temp files created in the current directory,
the program writes converted output to it, then the original file is
deleted and the RBS is renamed to original name. It seems this renaming
fails because (I guess) your desktop is configured to make the running
app's dir current dir. Set Thing to stay in current directory (top
window) while running Unix2st, and to give it only filename and not full
path as parameter, this should (I hope) solve the problem (it's the
default setting with Atari's desktop).

>You can download it all from:
> ftp://ftp.sn.no/user/hallvart/atari/unix2st.zip (45 Kbytes)

Thanks, it's easyier to use than the one I had!

Bye! Bruno.

2377. runtime error 200?

Newsgroup: comp.sys.atari.st
Date: 1997-08-28 00:00:00 UTC
From: jklimch@larry.cc.emory.edu
Message-ID: <5u2mt9$28b@lendl.cc.emory.edu>
Source record: 117895

Hi,

My falcon's developed an odd bug that interferes with operation of Zero-x. (at least that's the only program I've noticed it on yet). When I try to start the program (from the atari desktop or within geneva) I get the message "runtime error 200 at offset $000010E8". I've tried reinstalling the program from my backup, booting with a bare system, running the program from a backup hardrive & nothing seems to work. I was using the program earlier today & haven't changed my setup. I use cubase as well & it works so it's not the dongle port. Does anyone have any idea of what this could be?

Thanks in advance,
David Klimchak

Out of the ether, the following was mentioned by fvdakker@mrose.nl...:

f> The floppy disk does not boot, so I can't reset the NVRAM, but the
f> fan does work though...
f> Do you have any other ideas?
Do any of the power lights come on?

If not then it may be the 5 volt power supply as I believe the fan runs off
of the 12 volt side.

2379. Which JPEGD to use and where from?

Newsgroup: comp.sys.atari.st
Date: 1997-08-28 00:00:00 UTC
From: Spencer@mettav.demon.co.R.E.M.O.V.E.T.O.R.E.P.L.Y.uk
Message-ID: <7535_Spencer@mettav.demon.co.R.E.M.O.V.E.T.O.R.E.P.L.Y.uk>
Source record: 117897

I have recently put Gemview on my Falcon inorder to run some slide shows as a test of the machines stability (especially in the DSP side) after having some modifications performed on it.

Now the JPEGD.PRG which I am using is 9150 bytes in size and date stamped the 6th of December 1994 the problem is when using it it seems to blow Gemview out, i.e. Gemview exits and returns me to the desktop.

Is this the best JPEGD to use or would people recommend another one and if so where can I obtain it?

I just hope that its software and not hardware causing the problems.

> higher.

For the Atari there is no software available for changing this ZIP drive
parameter. The problem is that IOMEGA refuses to document anything
concerning special features of their drives. Without appropriate
information on how to influence the park time you can't write a program
to change the park time.

I'm back from vacation and will try to respond to some emails forwarded by Terry May:

* Originally from Bob Smith on 51:1/0, 16 Aug 97 09:28:12

Hi Terry,

Did Bryan say where in Florida? If I can get in touch with him, I may be able
to tell him where the Gemulator is available here in Florida.

Thanks.

Bob

-!- FIDOdoor 3.1.8 [IOSmail 0.89]
Origin: Inner Core BBS (51:1/19.0)

->Well, I am now living on Merritt Island, in East Central Florida, about 10 mi from the
Space Shuttle lauch pad. Yes, I am interested in both Gemulator.

* Originally from Tom D'Ambrosio on 1:209/7211, 16 Aug 97 02:45:00

O > He's hoping to get an ST emulator for his PC, so he can run some of
O > his old Atari software.

I've been playing around with v0.46 of the PaCifiST emulator for the past two
days. The list of what it "won't" run is almost down to zero. :)
Thought there is a nasty lack of keyboard remapping in this version. No
program that is a "shell" is usable. Eg: Mountain Reader now runs, but you
>can't use it. :(Ditto for Arcshell or Thunder.

V0.47 is supposed to be on the way. Damn nice for a free (actually
"giftware" now) emulator. :)

-*- Tom -*-

PS: Dave Munsie's old GFA/MAGE games run too. Kewl!

->Sounds good Dave, I'll have to give PaCifiST a try as well... Do any of these
emulators support the ST drive format on a PC? If not, did anyone ever write an
interface for Mint or something else to read them? I still have some newer files on the
old hard drives that would be nice to have (all the others are in tar format on an old
250Mb QIC backup tape).

* Originally from Dave Lee on 1:209/7211, 15 Aug 97 23:58:00

Glad to hear he has surfaced again. Mention that TAF ONLINE is still
using FIDOdoor and FoReM. He should get a chuckle out of that. There
is a great Atari Emulator out ther for the WINTEL Boxes, but needs at
least a 166 Mhz machine to work properly. No... it ain't Derek's kludges.

->Wow.. Gee, maybe you need an update? ;^) Anywho, I bet you are talking about the PaCifiST program, right?

Hi All,

Firstly, does anybody know what the latest version
of HSmodem is? I have been told that it is now up
to version 8, although I thought that the latest version
was 7.

Secondly, I am trying to network my Hades and Falcon
together via the LAN ports but I just cannot seem to
do it. I have tried using programs like Connect on
both machines to see if the connection is working but
at present, all I get are blank screens.

Assuming that the cable has been wired correctly I
can only assume that the problems lie with my
HSModem settings.

I am currently using HSModem 6. Can anybody out
there tell me what my settings should be?

Please could you E-Mail any responces.

Thanks,

Ben Hills.

> What is needed? (prog's, cables, etc.)

Null Modem Cabble, MiNT & MinTNet, NFSdeamon (to get file aces to the
Filesystem of the other Computer), some other stuff for Networking.
MiNTNet implements TCP/IP. You can even port most UNIX Networking
Software by recompiling it. Be aware thet MiNTNet is rather
MemoryHungry. My Falcon with 4MB is not enough to get a Setup that is
not just a touy or doesnt hogg all the Memory. With at least 10MB you
should even be able to run X11 (on the TT in monochrome, but the Apps
can run on the Hades).

Chrsitof

2384. STing stuff...

Newsgroup: comp.sys.atari.st
Date: 1997-08-28 00:00:00 UTC
From: thechyld@pcc-uky.campus.mci.net
Message-ID: <872761952_OASIS_@pcc-uky.campus.mci.net>
Source record: 117902

Okay, here is what my logon to my ISP (UK Online) looks like...I saved this using CoNnect...

CONNECT 28800/ARQ/V34/LAPM/V42BIS

} } }%}&W}'}"}(}"t8~
NO CARRIER
ATH

As you can see, the logon using STing goes fine. I get to the part where it says PPP session from (number string) to (number string) beginning...at this point the last (number string) is shown in STings IP window, and it tells me that I'm connected and online, then quits. However, the modem LED flashes once briefly about every 5 seconds (its the odd characters after the word beginning) and then, about 2-3 mins. later, the ISP logs me off. What are they looking for from STing, that STing is not sending them? I use Oasis v1.35e with this ISP with no problems.... Thanks for any help! :)

Hi Scott,

I used a bjex10 with NVDI & atari works for a year or two (til I stumbled into a closeout stylus pro). Setting it up is kind of tricky. I thionk the problem is that speedo & NVDI set up borders differently. NVDI includes the printer's borders as part of the paper size. You can check this by clicking the set size to current printer button in the page setup menu. Then it's just amatter of juggling borders until you get the border offset that you want. It's a real pain in the rear compared to speedo but the increased speed, lower memory consumption & compatibility with current software makes it worth it.

Hope this helps,

David Klimchak

That's exactly the same line my ISP provides. I used:

WAIT = 0
REPT =
FIND =) to
RESP = $GET_IP

Doing this, I got the dial.app to display the proper IP number in its window (but I still can't resolve any addresses other than my own with this account, I think because I don't have the proper DNS set, using the DNS from another ISP that I have succesfully connected to with PPP [I'm trying to test Sting with three different ISP's, you see]).

Anyway, I hope the above helps. I'm reasonably sure the second number is the one you want to grab, and using "FIND =) to" should get it for you. Don't wait half a second, as you do in your script, you might miss it!

PPP negociates the Client_IP internally.

Contrary to SLIP, you don't need to have a $GET_IP line.

>Here is the line my ISP provides:
>
>PPP session from (207.168.90.13) to 207.168.90.164 beginning....

Which is displayed purely for reference, as PPP receives
this internally (the PPP negociation is the "garbage" you
see on screen, when loging through terminal).

jp> internal HD. Anyway the big mystery is what happens to this RAM?

Especially with CAB, each page seems to be held in RAM until you reach the minimum RAM setting you've set up in CAB, in which case the info is forced into your HD cache area. When running Magic, if you call any other program and then return and continue in CAB (even if the other program is an installed application or accesory like STGuide) you will never see that RAM again due to fragmentation in memory. Something like FREEMEM.CPX will show you that it's still actually there, but it'll never ever get used.

Similarly, if you change resolution, continually - even without ever running a program after each resolution change - your RAM will drop and drop withoutever seeing the light of day without a reboot. This just seems to be a deficiency in Magic itself.

I'm constantly rebooting with Magic to get over these problems - luckily less so since I moved to a 6Mb TT, thank god...

You'll just have tolive with it until you can afford a RAM upgrade B^{<

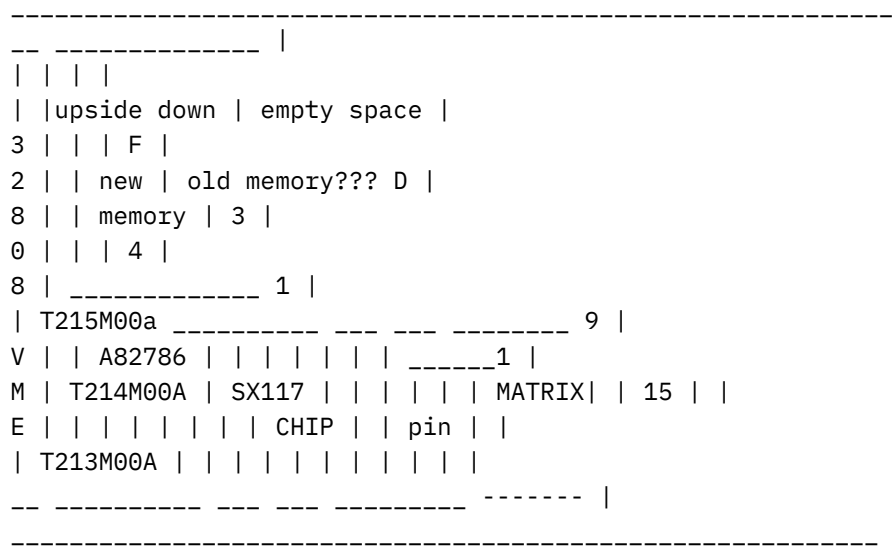
2391. HELP! Matrix Board HELP!

Newsgroup: comp.sys.atari.st
Date: 1997-08-28 00:00:00 UTC
From: bdc2@po.cwru.edu
Message-ID: <5u49ne$gdv@alexander.INS.CWRU.Edu>
Source record: 117909

HELP! I have a matrix board of some type that looks like this:



It's a standard VME size board.The matrix chip was removed, added to a piggy-back card with standoffs.
The 32808 is printed on the connector. The FD34191 is on the board foil.

Does anyone recognize it? I need to know how to install its software?
Does anyone know someone who has a Matrix card? Could you ask them to take a look?

From: darmok@leland.Stanford.EDU
Message-ID: <5u4crg$m0b@elaine3.Stanford.EDU>
Source record: 117910

Hello - I'm trying to convert a .ST file to a disk so I can use the game
on my ST - it's on my Falcon's F: drive at the moment. So I try to use
this "STTODSK.TTP" file (which is suspiciously small, 2.3k :)
I use what I believe to be the proper syntax -- A: F:\file.ST
and I have everything in the same root directory of F:...
and some error message flashes by too quickly for me to tell what the
problem is. Does the disk have to be formatted correctly? Can anyone
help me?
thanx -
phil

Okay, just a stab in the dark here:

Some of the new CDs coming out, including those for the Atari have a
mixture of file names in both upper and lower case. If you are using
ExtenDOS to access the CD-Rom you will find that only upper case
folders/files will be accessible. The Germans use another program and this
can handle mixed case filenames etc.

I know of at least two other CDs that are unreadable under ExtenDOS. Atari
Gold (of which there is a Upper case only version) and the Essen Trinken
Feiern graphics disk.

I'm surprised that 16/32 have ignored your request for help. I was the
person that found this problem and told Nick Harlow personally!

I am not sure if Roger Burrows is aware of the problem and if there is a
patch for ExtenDOS. Anyone have contact with him?

Kind regards
Mike Kerslake

2394. Mike's Mega Sale - Part Two (UK)

Newsgroup: comp.sys.atari.st
Date: 1997-08-28 00:00:00 UTC
From: publish@zetnet.co.uk
Message-ID: <5u4df0$1ir$2@irk.zetnet.co.uk>
Source record: 117912

Mike's Mega Sale Part Two!

Time for a final clearout of my surplus Atari gear as I'm saving up for an expensive addition to my Falcon set-up!

HARDWARE:

* 270 Mb SCSI HD with Top Link in small casing with PSU - excellent condition, and very neat and tidy. Would 60 quid be excessive? If so, make me an offer!

* Epson LQ400 24 pin dot matrix. In excellent working order and built to last forever! Offers invited.

* Quickshot amplified stereo speakers for use with STe or Falcon, and just about anything else that you can connect phono leads to! Offers around 20 quid invited.

* Ladbroke steel case and power supply for SCSI hard drive, there's an ADSCSI Plus interface built-in, that may or may not be working! Case and PSU are in excellent condition. The case will happily support a standard Atari monitor. Offers invited.

SOFTWARE:

SpeedoGDOS 4.2 - 6.00
SpeedoGDOS 5.0 - 10.00
Truimage - 8.00
Trupaint - 8.00

All items are plus postage, or can be collected from me in Sheffield, or delivered to the Atari show in Birmingham.

I'm open to offers if you want to buy two or more items!

Kind regards
Mike Kerslake

Source record: 117913

Hi,

I've just tested the program BARREL (known from a FAQ). It works
fine, but it's me who is too lazy, and I'd use a program which holds
all the output in a disk file until I find the time to look
what's there and print it at once (I don't have any printer here).

Bye
Guentcho

{P.S. BTW, are there any SCODE-decoding programs for other
systems (Unix, DOS)?}

>SUBJ: Battery for TT clock???
>
> d> I had the same problem, and someone said that I could replace the
> d> battery with two normal AA alkaline 1.5 volt ... so I did and until
> d> now my TT clock works perfectly ... even better than before ...

The Lithium battery should last 5-10 years, while the AA batteries will
last no more than a year or two. If you want to open your box every
year or two, and risk leaking alkali over your circuit board, thats
OK with me.
I found the right batteries at Radio Shack for $12. Per year that
works out about the same as AA batteries without the risk!!! And without
the hassle of opening up the box every year or two! True 3.0 volts vs. 3.6
is not much and the clock will work fine with the AA's.
Do yourself a favor, find the right batteries, and get those
alkaline ones out of there!!!! If you notice my sig, I am a professor
of Electrochemistry, and batteries are one of my specialties.

You can always try CAB with graphics turned off. I'm not sure this
will fit in 1/2 Meg, though, but worth a try with a PD version of CAB.

You can avoid loading GDOS/NVDI and put up with the system font to
save space.

CAB seems to be a little more stable when using Sting, rather than Stik, to access some pages. One of the worst ones is within the Acorn pages. BTW, the only reason I keep visiting them since I'm saving for the RiscPC (give PC and Archimedes compatability in one box) and want to know what's happening with them.

Using Sting, I only get the occasional couple of bombs, whereas with Stik, it's much more often. 2 bombs followed by a reset, just so CAB doesn't lock up. I don't mind the slight drop in speed for the massive increase in stability.

> Should Sting work with Geneva?

No idea whatsoever, I still use TOS 1.62.

STalker will handle text-based web browsing, and it'll run on 1/2 Meg, SS drive. You might have to have someone set up a SS disk for you. It's commercial, from Gribnif (one of the very few companies still supporting ST's).

Even dutch is supported.

>That explains why it recognised keys others have problems with. Most
>notably is the backslash \
>

In fact (according to the documentation) Tos2Win is very closely
linked with Windows 95, even the screen output uses the native Windows
routines: this means that screen output is faster without nvdi then
with it (because nvdi doesn't access the Windows routines directly).
So, only install nvdi if you need gdos (how you can start nvdi without
its 'faster' screen drivers, but only with gdos, is explained in the
Tos2Win manual, although only nvdi 3 (or maybe higher) works that
way).

>Have I missed a site with english docs and an english resource?
>
Well that's a problem: I have the cd with Tos2Win 2.0, and I can't
find any english documentation, only german. Maybe they forgot to put
it on the cd (I got one of the first). But if you have some questions,
don't hesitate to ask me.
The program itself works in english, but you only need it to set up a
new Atari program. As soon is the settings are correct, you just start
the Atari program by clicking on it (as it were a Windows
application). So, if you have an english application or desktop

(Teradesk, Gemini, ...) you will never know that Tos2Win is a german program.

>In the best of all possible worlds I'm after an emulator that emulates
>everything atari! :-)

That's a problem, I think.

>
>As that's expecting a bit too much, I need an emulator that can run
>the MWC compiler. There's a caveat though - it also has to run MagiC.

I don't have the MWC compiler, so I can't check it. If you really want to use MagiC, I think Tos2Win is not what you want. But why do you want it ? The extra functionality may be a reason, the multitasking is not, because Tos2Win can start a lot of Atari applications at the same time.

Hi Ian

Just ignor all the settings in the CPX set the fies manually with a
text ed. Set only the serial CPX to the port and speed and save that.
Set the protocol cpx to enabled enabled. Everything else is set from
the Default.CFG and the DIAL.SRC when you boot and then turn on the
dialer. the 127.0.0.1 is the internal route for the dialer it seems
set the route.tab to all 0.0.0.0 plus the port name. this works and
there is no need for get_ip this should happen after your sword:
command is sent to the IP. Dont worry about the CPX defaulting back to
modem 2 everything still works. If in doubt before starting the Dialer
just set it to the which ever port but dont save. If you want my
scripts email me at the address.
Regards

This is only true if your Internet Service Provider is providing you with a telnet shell from which you can run a program such as Lynx on their machine. If that _is_ the case, you could use any terminal emulator, including shareware, freeware, etc... A good one if you have a color monitor is Freeze Dried Term.

If, however, your ISP is not providing this service (and many do not), you will need to use something like STiK or STing to connect, and then run a program on top of this like CAB. I remember that STiK runs in less than 512K, and suspect that STing does as well, but I have no idea if you will have enough memory after this to run CAB with images turned off. But give it a try, all the software is freely distributed (CAB through v 1.5, and all version of STik and Sting to date).

2411. FS Atari PTC1426 Monitor

Newsgroup: comp.sys.atari.st
Date: 1997-08-28 00:00:00 UTC
From: kvvuuren@worldaccess.nl
Message-ID: <5u4r95$m9511@easy4.worldaccess.nl>
Source record: 117929

```
Hi,
```

I have for sale my three year old Atari monitor type PTC1426. It's a 14"
colour VGA monitor intended for the TT, but also perfect for a Falcon.
I'm asking fl.200.- = $ 134.- = € 67.- = DM 200.- for it (and then you
get it in the original box to! ;^).

```
If you're interested, please email me. Please also mention the
country where you live, so I can estimate the postage costs: THE PRICE
IS WITHOUT POSTAGE!!

bye,

Karsten

Thats a nice explanation, but does not help one bit in solving the problem!
I mean, if you don't use $GET_IP, then what do you use/send to successfully
complete the process?

Thanks in advance...! :)

Hello M-E,

Well, so what's the next step? Is there anyway to know/check that STinG DID get the IP? Some evidently have success with the $GET_IP. I don't as you correctly stated. Unfortunately, I, as well as others, can't get STinG to get the IP otherwise. Some get 127.0.0.1 as listed in the default.cfg file (DIALER = 127.0.0.1). Changing the CLIENT_IP = 0.0.0.0 or leaving it blank doesn't help either. Are we missing something? As you know, if STinG doesn't get it, you can't resolve anything...

So far it seems that those who are having these problems are using commercial servers that generally only have Micro$roke/BigMac users ;)

Regards,

Charles

2415. Next Atari Shows in UK?

2416. SF314 Drive problem

Newsgroup: comp.sys.atari.st
Date: 1997-08-29 00:00:00 UTC
From: Stephen Knox <gooch@pop.erols.com>
Message-ID: <3406CD31.7893@pop.erols.com>
Source record: 117842

I've got an older SF314(has the big eject button across bottom) DS drive thats acting up. Whenever I format a disk or try to read it it sound slike the drive head is banging the top of the case!

I was wondering if:

1. I could do something to possibly realign the head(probably not)

2. Find a resonable replacement. I've checked 2 places that I know and 1 wants $80 and the other wants $100+ for a replacement mech.

Anyone know how I can get this thing fixed reasonably (or buy another one)?

Thanks,
Steve

PS,
Please respond via email since I don't get around to reading this group much.

Willard VanderPloeg wrote:
> Hi all.
> Any idea how to decompress a file like this?? "file.tos.z"
> It won't decompress for me?!
> Willard VanderPloeg

yo ho ho
you've got a unix variant of STzip.
look out for Gnuzip, that should decompress this file.
"tos" in this case may be simply teling you it is an Atari
file, since tos can also be a zip file that has been
converted to self extracting, as well as its _original_ meaning
which is a prg that runs without GEM, both cases which
are not likely in this case, but then I don't know what
this "file" is supposed to do.
Gnu zipped files _usually_ have the appendage .gz; and a single
file which is made from many files is considered to have been
tarred and usually has the extender .tar
You will see many files that have been both tarred and zipped,
which will have the extender .tgz
It is well to have on hand a "de-tarrer" (turpentine? :^)
as well as Gnuzip, or to have the possibility of MiNT
to more easily de-tar and un-zip, and of course tar and zip.
good luck.bonne chance

2419. Need 1st Word disk fixed

Newsgroup: comp.sys.atari.st
Date: 1997-08-29 00:00:00 UTC
From: kms8@0.0.0.0
Message-ID: <5u6m3u$1138@r02n01.cac.psu.edu>
Source record: 117845

I have 1st Word that the disk has gone bad on. I'm hoping someone will be able to re-copy the program onto my disk. It is a legal, commercial disk, I'm not asking for pirating, just fixing.

Does anyone out there have this program and can fix my disk? I think the disk would need to be re-formatted because it was placed on a magnetic source (along with about 100 others). I would pay for shipping of the disk, of course.

I don't regularly read this newsgroup, so direct email would be better.

:
: Ahh, I've tried CHAP, PAP, SAP, and CRAP <g>. Just a little joke :)
: I've had some problems getting the Sting Port Setup.CPX to save it's
: settings as mentioned in the docs for PAP. It creates a file called
: sting.prt but doesn't seem to work. I put it in the STING folder.

sting.prt in my system sits in the root of my C: drive, even though the
rest of my Sting files are in a folder on my D: drive. I think the CPX
looks for it on C:, so yu might have better luck if you put your sting.prt
file there.

: Anyway, if you have a method of getting a PAP connection please post.

I haven't made use of this feature. I don't understand it either. It
would be nice if someone who knew this stuff would explainit all to us
mortals.

: As I mentioned, I can't seem to get my Dynamic IP address loaded into
: STinG, or a way of checking if it's correct.

Well, at least Sting does come with some testing tools. Once you can use
the dialers Ping to ping your DNS, you should be OK, on the 'net. But
getting your setup to that point, for me, is like riding out an automobile
accident -- I just keep my fingers crossed and hope for the best.

A PC drive will work fine as a replacement mechanism, even a 1.44M one will
do. You might have a few mechanical issues with the eject button (just cut
a hole in the case) and a few jumpers to set, but that's all explained in
the FAQ.

THE ATARI ST QUICK FAQ
v1.4 - June 2nd 1997

In order to save bandwidth and avoid comp.sys.atari.st newcomers asking the same questions over and over again, here is a quick list of the most Frequently Asked Questions (FAQ) and, hopefully, useful answers.

http://www.geocities.com/MotorCity/2090/quickfaq.htm (USA) HTML version

or

ftp://ftp.sn.no/user/hallvart/atari/info/quickfaq.txt (Norway) ASCII version

If you don't have web or ftp access, send me an e-mail at the following address, and I will be happy to send the FAQ to you:

bales@garonne.stortek.com

This announcement is manually posted once every week.

Nick

Out of the ether, the following was mentioned by
404on040@iwvisp.nospam.com...:

4> Ahh, I had heard rumor of this digitizer, but never seen one.
4> Spencer, do you know what the specs are for the digitizer part of
4> the card (frame rate, maximum image capture size, ect)? Then I will
They're probably in the documents which came with my TC1208e graphics card
but I have two problems on that front a) finding them and b) they are all in
German which I haven't a hope in hells chance of
understanding!

4> sell:). I have a Matrix screeneye on my Falcon. Does the card come
4> with software for setting up the video digitizer only? I wouldn't
4> mind trying it out on the Falcon, if so. The Screeneye software
4> leaves a lot to be desired.
Ahhh, but the digitiser in question only works on the Matrix VME
graphics card which is intended for the likes of the TT (which I
have) and MegaSTe. Why don't you try Apex Media which supports the Screeneye?

Or why not get an Expose digitiser? I have one on my Falcon and think its the
bee's knees for grabbing stuff.

There is definitely something suitable for the HP-DJ500 as I have it on a disk somewhere! Do you want me to have a good look? I used this driver with 1ST Word + with my DJ500 for quite a while.

>and Signum!2. Are those drivers available somewhere (via FTP or ...)?

No idea about Signum!2, but I would be very surprised if there isn't something available!

Kind regards
Mike Kerslake

I believe that a lot of the CIS stuff exists at UMICH and also on the
PoolDisk that was produced by Ernest and Bo Schreurs in The Netherlands
about two years ago, but I also see that William Kendrick replied to
your message, so I'm going to look at this reply before commenting
further on UMICH.

I have a CD full of Atari ST software. There are a bunch of files in .msa, which is cool, others are in .zip, .st, .lzh etc. but the format I know nothing about is this .dim, which most of my favorite stuff seems to be in. How do I convert this to a normal disk, does anyone know? Thanks for any help. -Satcom2

Le> reads it happily, so there is obviously some incompatibility between
Le> my drive and the disc.

Hi,

well because you have a legal cdrom, you're allowed to make a copy of it.
Find a friend who owns a CD burner and a pc which reads all files
from the SDK CD without any problem, and have them copied to his HD.
Let him burn a CDR for you with those files from the HD.
Let it be written in the ISO 9660 format, let him write protect the CDR
(so no multi sessions), and let it use DOS filename format
(no joliet stuff, i.e. Windows 95 format).
A CD written in this format can be read on any platform.

If the CD you've been send WAS a CDR to begin with,
some CDR can be read without problem on a pc, but show difficulties when
it is done on an Atari. We noticed that when we burned CDR's ourselves...
Make sure you have a CDR with a "green" mask at the side to be burned...
TDK or Rainbow CDR are ok.

Bo.

Actually, if I remember well, 1st word was made freeware when 1st Word Plus
came out.

Not that it is any good nowadays compared to most other shareware or
freeware packages, like Marcel.

I have a copy of 1st Word that came from a PD library. I'd be happy to
email it to you, but it's a french version. Maybe it can be found on umich,
but I'm not sure.

Just to make things clearer: There is absolutely no SCSI-interface in an old SH204 or SH205. They use MFM or RLL drives and nothing else. To use SCSI you have to use one of the available SCSI-interfaces instead.

2453. POPwatch 2.21 released

Newsgroup: comp.sys.atari.st
Date: 1997-08-30 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <13898610_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 117734
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

POPwatch is a POP3 mailbox tool for use with STiK and Oasis1, Oasis2,
and NEWSie.

Version 2.21 is now available from my web site (see .sig).

Changes since version 2.20 are:

*Now will not send email from Oasis1 if it is 'held'. Previous
versions of POPwatch used to ignore this status and send it
regardless.

*Now doesn't get confused between email and news articles when sending
from NOS/Oasis1.

*X-Sender line is now inserted immediately after the X-Mailer line.
It used to be inserted at the very end of the email header but this
caused problems when sending MIME emails from Oasis2.

Regards,
Gary

I just got my Best catalog and I have to agree. This truly is the best
Atari
catalog that I have ever seen. It is not only a major parts book but
also a
History book as well. There are lots of Atari Tips inside too.

I think anyone who still owns an Atari would be very happy with this
purchase.

There was an amazing story behind the printing of the catalog that as to
be read
to believe.

Just my 2 cents.
Neron

> Falcon, including formatter, driver, etc.?

First of all, you have to make sure it's SCSI, and not parallel. (But you
probably know this. Just have to make sure).
Then you need an HD driver which support removable media's. HDdriver, SCSITOOL,
ICD should all work. I prefere HDdriver.

It will work fine with AHDI V6.06, although I use HD Driver on my
Falcon/IDE/zip/EZ135/CD-ROM set up (Extendos for the CD obviously).

Is it possible for the directions to the show which
is being held in Birmingham to be sent to me via
email or is it clearly signposted along the M38 as
I am thinking of coming down if I can make it .

Cheers

Barry Rae

When you first start to use STiNG there is NO cache (usually held in
STING/CACHE.DNS) so you will get this message. As soon as you have
made a successful "resolve" with a host the file will be written and
you will no longer get this message. Panic not!

I'm certainly going to try this, Chas.

>Again, use your best MTU setting in the dial.scr. That's it. NEWSie,
>POPWatch, CAB now will at least download at speeds similar to STiK.

So, you use Newsie/STiNG, do you? I have spent AGES trying to get this
pair to work and eventually explained my failure when I noticed that
John Rojewski still had "Support STiNG" in his "to do" list. Now I'm
even more confused, mate!

Confirm, please ... you use SLIP STiNG Newsie and it all works fine?

If so I have 2 queries ...

Why can't I do it? :-(

Why does John reckon he still has STiNG support to do in Newsie?

Normally I would suspect that the partition info. in root had got
messed up.

>Using "Diamond Edge 2" I found out the following when going to the
>"Partition disk" menu, that all my 5 partitions were available (C,D,E,F,G)
>but the start/end numbers had some gaps between them. I.e. partition C:\
>ended at say 25845 and partition D:\ started at say 25847.

This is quite normal. The "spare" sectors are occupied by the
boot-info for each partition.

>When I boot the system it only shows up with partitions C,D,E,F and they're
>exchanged somehow;
>
> C = C
> D = E
> E = F
> F = G
> G = non-existant

Yes, it just can't recognise D: so carries on naming those that it can
find in order.

>Anyway, using "Diamond Edge" it shows that I have 5 partitions, so it
>should be possible to salvage the data... I just don't know how.
>Can anyone help me?

Yes. You are in with a very good chance. The FATs ,directories and
data are still there. It's just that your driver can't find sufficient
admin. data to "mount" the partition.

I'd normally suspect the root info in sector 0 but you say that this
looks fine as read by DE. The partitons appear to be mapped onto the
correct areas of HD. Are they all turned ON? I'm not sure whether DE
shows this info. but ICDFMT certainly does. Your first attempt should
be to just re-write the partition info. in sector 0/1. Will DE do
this? If not then ICDFMT certainly will.

If this doesn't cure things I would suspec the boot info written in
front of each partition (those 2 spare sectors you were worried

about!). You don't actually want to "rebuild" the partition as this may well zero the FATs and directories. Have you got access to ICD's CLEANUP? This may identify the problem and fix it.

Otherwise the hacker way is to re-write the boot info using a disc editor. The Supra Utilities has a function in its EDIT program which is fine for this but I expect any old sector editor might do.

The principle is to read the 2 sectors which are in front of a "good" partition of the same size as the partition you have lost and to write these back in front of the "bad" partition.

Use the sector numbers from DE to locate the boot info. The two sector area has the "signature" of whatever software you used to partition it in the first sector.

Good luck! It'll work, honest!

Hi Terry,

in a message dated 29 Aug 97 Terry May wrote:

TM> I'm getting a "DNS cache load failed" when STinG loads from the AUTO
TM> folder. Can someone tell me how to fix this?

I often have this message too, *even if* the file cache.dns allready exists,
i.e. I've allready been connected successfuly.

I sometimes get the 'famous' two bombs too but cannot reproduce exactly what
I've done to get them. Someting to do with at least one (witch?) cpx ?

My real problem is with cab (2.0) who seems very slow. Perhaps something to
do between Sting (1.06) and the ovl (1.2618) ? The modem seems to receive
datas witch are not transmited to cab...

Bye Terry,

This has come right now, Peter, not sure what was causing it as I was
using the DIAL.SCR from the previuos version of STiNG.

BTW, I have only just noticed that "Support for STiNG" is still on
John Rojewski's "to do" list. This may well explain why I have had so
many troubles with Newsie/STiNG!! :-((Silly boy. I will have to
confine my STiNG evaluation to CAB - the only other client I use.

Nothing apart from the usual HD tools which I assume you have.

There is some special stuff in HDDriver if you're interested in file
permissions but these aren't really neccessary.

Yeah, read the directions! (grumble, grumble, grumble ;-)

This is not an error message. Until you successfully connect with
Sting it won't have a chance to create a DNS cache. Sting is just
making note of this fact for you. Peter got complaints about this
with the first release of Sting, even though it was noted in the
documentation, so he made it even more clear in the documentation this
time, and people are still missing that point. I can't figure it out.

Is this a recent copy of their data? I know umich (?) has a bunch of stuff
from CIS but I know they don't have everything. I remember their being tons
of stuff more when I last used CIS in the 80's. When the new version of 1030
Express came out. In fact, there should be a program of mine up there that
converts version 2 to version 3 phone files.

If you want some help I could lend some time to it. I'm not sure how you
want to do it though. A large tar ball of some stuff would work for me.
(Guess I should get the Unix Atari emulator up and running...)

Hi - I'm being lazy, I know I could use a terminal program, but I like the convenience of Newsie....

My problem in a nutshell: I'm trying (for example) to download an etext from ftp://sailor.gutenberg.org/pub/gutenberg/etext96 - I want to get a filename beginning with "p" but the directory stops in the middle of the "d"'s - How can I change this? I've read the posts here, and the documentation, and even done a lot of experimenting. Nothing seems to work. I'm sure it's something simple, but I can't find it.

I'm on a 1040 STe w/4 megs, 2.5 megs set up as a ramdisk, no hard disk. I've tried STiK/slip and STinG/slip/cslip/ppp ... Newsie .72/.74/.78

Thanks

Why do you call it wrongfully ? STinG simply does not support the
F_Serial way of doing higher baudrates. This is mainly because HSMODEM
has become an accepted standard here, and even overseas people seem
to use F_Serial only because it boasts a nice setup utility, contrary
to HSMODEM. The latter is in the past now, with SERIAL.CPX which comes
with STinG or can be fetched separately from my web page. I can under-
stand that HSMODEM has become a de-facto standard, because it appears
to provide much more flexibility, especially when it comes to adding
and supporting non-standard ports. Note with HSMODEM you can use the
serial port on a Macintosh (with MagiCMac) !! This has been demonstrated
with STinG, which works well on the Mac !

I would probably add F_Serial support too, if I had more time, but there
are so many other things to do ...

> well enough to fool STinG.

Why fool STinG ? What for ? STinG uses the MAPTAB vectors to access the
serial ports. I cannot understand why F_Serial fails with STinG, after
all the vectors are documented features of the drivers, if F_Serial does
not install them, it must be called improperly and incompletely done.

> Still, I can vouch for Peter's new CPX, as it allowed me to

Good, this means your problems were mere setup problems.

Huh ??? It certainly doesn't here, I use COPS V1.06 too. I cannot test with
TOS 4.04 though, but I guess I had got more reports like this if it really
were due to the CPX. Please try to only load, say, the STinG CPXs with
SERIAL.CPX, to avoid interaction with other CPXs, just to check whether
another CPX is responsible.

Does the modem Send-LED flicker when you start the Ping ? Have you read the
STING.FAQ ?

> I tried at first to continue using FAST_SER to configure my Serial 2 port
> on my TT to faster speeds, but I suspect that STING requires HSMODEM. I

No. It does require serial drivers that install MAPTAB vectors, like docu-
mented by Atari. I suspect F_Serial does not do this which certainly is
a bug in F_Serial. Note it works without HSMODEM too.

> only got some degree of success after I re-installed HSMODEM, but I have

Must have been due to the 'Port Setup' CPX. It really is only for configuring
a LAN, which is stated in ESTABLISH.TXT, but obviously not clearly enough.
I wonder if I should add a Q:A: into the STING.FAQ, since nobody appears
to read this file ?

Yes, but only for maximum compressible data. This is almost never
the case. For IP traffic, in fact, you have additionally the TCP/IP
headers that hamper modem data compression, so 19200 bps is quite
appropriate for a 14400 bps modem that is only used for Internet
traffic.

> However, Using Modem 2 is usually preferable, from a data safety

It is. You might see the data transfer ocassionly lock up for a few seconds,
this is a problem most likely due to STinG's TCP. It does in no way render
Newsie unusable though.

This is very unsual. If ping to the outside works, receive should work,
regardless which client. Open the Dialer's statistics tool, and choose
your modem port, and TCP in the popups. Now run ping, and then try to
receive data in any client, while keeping the statistics open. Do you
see excessively many dropped packets shown ?

On the resolving problem, you might want to use another name server. Ask
your ISP.

I've suggested to turn the VJ compression off when using PPP, because I had somewhat inconsistent reports on how well the compression works. Some say it works well, others say they have problems. Often the problems turn out to be due to some other mistake ...

Make your choice. Whatever it is, it'll not prevent you completely from having success, since PPP automatically negotiates the use of VJ compression. Once you've had some success, you can still determine whether it is better to have it on or off. It'll be used only if you have it set to on and your ISP's PPP agrees on this.

Sounds as if you haven't properly set up the script ??

Use a terminal emulator, like CoNnect, Rufus, STarcall, etc. to manually
login into the ISP's modem server. This way you'll learn what the ISP
sends, and what it expects as a response. Read the comments in the sample
DIAL.SCR carefully to learn how the script part works. Use $GET_IP only
if there is a text IP address to fetch.

> Oh, and can we learn a bit more about PAP and how do we find out if
> we need it. Time to call our ISPs?

Setup the script first, but you can add your account name and password
into the corresponding Dialer PAP entries anyway, won't hurt if not needed.

Depends on the ISP. PPP is capable of doing it automatically, if the ISP wants
it to do it this way. So use a terminal emulator to find out how the script
is supposed to go. If there is an IP address, fetch it, if not, be sure it
is grabbed by PPP automatically.

Sounds as if you did not tell STinG to use PPP ? Have you clicked the PPP
button in the Dialer's Port Parameter and clicked Accept, or alternatively
changed the PROTOCOL variable in the DIAL.SCR to 1 ? You're sure you use
STinG V1.06 ?

Make sure to respond to steele@wolfenet.com (see sig).

I've sold a bunch of stuff, this is the rest of it. All the best games I've found on
the ST. Buy it piece by piece, or take the whole list for $75 (plus shipping) or best
offer -- that's for about 80 titles (excellent deal folks). I'd like to sell this stuff
ASAP to make space for my other stuff.

All items include original disks and manuals. Some include boxes. They are all clean
(no gross stuff on the manuals) in new condition, etc.

GAMES (The best of the best)

After the War
Alcon
Alien Storm
Batman
BattleChess
Battleship
Beach Volley
Blasteroids
Blood Money
Boulder Dash Construction Kit
Buffalo Bill's Rodeo Games
California Games
Carrier Command
Chaos Strikes Back
Codename Iceman

2500. Epson GT 4000 scanner

Newsgroup: comp.sys.atari.st
Date: 1997-08-30 00:00:00 UTC
From: ingo.marks@t-online.de
Message-ID: <5u97r4$q5d$1@news01.btx.dtag.de>
Source record: 117781

A friend of me owns an EPSON GT 4000 SCSI scanner connected
to his TT 030 via an interface to both the parallel
and serial port (the serial port seems to be needed just
for current because there are only two wires).
Recently his scanner failed, and he asked me to have a look
into the interface (at the parallel port).
There is a label "GT*TT Interface 3K Computer Bild" visible on it.
Inside I see a 16 pin integrated circuit with the main
label scratched away (only a part of the rest of it -
SP9108 or SR9I03 or so - is visible).

Does anyone own the same scanner and could have
a look into his interface to tell me the type of the IC ?

Thanks for your reply!
Ingo

Something in the dongle search and timing routines built into the software.

Apparently the PAK30 board has an optional 68000 and the whole business is switchable, so in theory one could rum Calamus SL on the 68030 chip with every cache on and the machine screaming, then later switch back to 8/16 mHz and run Notator SL.

But that is only theory.

Has anybody out there actually done this?

JG

Help discovering what all of the 8.3-named files are and getting
descriptions (blurbs) for them written and categorizing them.

hi atari lovers!

i had a quick question i was hoping someone in the know
could help me with! i have managed to find a really old
atari ST hard drive, it is an ATARI SH20 or similar i think.

Problem is - it didn't come with a cable! so i need to
either (a) buy one - pretty unlikely i guess or (b) get one
made. would anyone have any info on either of these options?

ie maybe pinouts of the cable, or info where i could get such
a cable.

i would really really appreciate it, thanks a mill

Don't move the file. The CPX looks for it where you saved it to.

> *Reject for protocol 0xfffd*

The PPPD sees packets for a protocol 0xfffd, which it doesn't know and
thus rejects. Don't expect me to look up what it means, but it surely
is none of the normally used protocols.

Some likelihood is that some other data has been mistaken for a PPP packet.

> Aug 27 14:33:18 Falcon30 pppd[86]: local IP address 195.154.2.183

Larger MTU is not necessarily better ! It slightly reduces overhead, that's
true, but deteriorates responsiveness when running two or more clients across
the same connection.

What are you talking about here ? Are you setting up a riddle for me to
solve ? ;-)

CHAP and PAP are pure authentication 'subprotocols' of PPP. There is
no such thing like a PAP connection. The 'Port Setup' CPX also has nothing
to do with PAP. If you need PAP for authentication on a PPP connection
which you wanna set up with the CPX, you must put the PAP info into the
corresponding variables in the DEFAULT.CFG.

STinG does not support CHAP as yet.

I wasn't talking about lack of Fast_Serial support.

What I mean by the above is that STinG blocks access to
34800/57600/115200 and other baudrates over 19200, even
though they ARE available on a standard M-STE/TT/Falcon.

It seems when the RSVF cookie is NOT found, STinG assumes
that above 19200 isn't available.

>Why fool STinG ? What for ? STinG uses the MAPTAB vectors to access the
>serial ports. I cannot understand why F_Serial fails with STinG, after

(read above)

STinG relies on the presence of the RSVF cookie to allow above
19200, even on SCC-equipped machines, so if someone prefers to
use Fast_Serial, they have to somehow install a "fake" RSVF to
get STinG to accept settings above 19200.

>> Still, I can vouch for Peter's new CPX, as it allowed me to
>> finally get HS-Modem to work correctly on my TT.
>
>Good, this means your problems were mere setup problems.

Nope. Problems involve STinG not allowing above 19200 if
the RSVF cookie isn't found.

However, since your CPX allows correctly setting baudrates,
because it properly substitutes baudrates in the BIOS table,
then it manages to make HS-Modem work where it used to fail.

So, Fast_Serial support is less of a problem, although STinG
should at least allow higher baudrates even without HS-Modem
on SCC-equipped machines. STinG should NOT require HS-Modem.

One slight oversight:

When the MIDI.PRG is used, the baudrates/flowcontrol values
shown do NOT correspond to available values and the portname
is "BIOS 10" instead of MIDI. If you're interrested, I have
a nicer and more complete RSC that comprises this for a new

version of your CPX. Just e-mail me in private for details.

>John Rojewski still had "Support STiNG" in his "to do" list. Now I'm
>even more confused, mate!
>Confirm, please ... you use SLIP STiNG Newsie and it all works fine?

Roger, Roger :)

>If so I have 2 queries ...
>Why can't I do it? :-(

Try those new settings. If STiK/NEWSie works with zetnet, then STinG should.

>Why does John reckon he still has STiNG support to do in Newsie?

Maybe he can't get STinG connected to try it??? Again, change these settings
in the default.cfg file:

MSS =
RCV_WND =
DEF_RTT =
DEF_TTL =

If you want to experiment, just change the MTU in the dial.scr. STinG is
very picky about this. With my server STiK likes 1500 (MTU), STinG works
best with 1106/8.

Regards,

Charles

P.S. I single task TOS 4.04 with STinG. Can't test MagiC/Geneva/N.AES.
MultiTOS/MiNT will NOT work with STinG, only STiK.

P.P.S. Remove any NG files loaded with STiK before trying NEWSie with STG.
Just a pre-caution :)

P.P.P.S. This is posted using STinG/NEWSie

>/Pascal/

Bonjour Pascal/Terry,

This has been posted before, but I had this problem originally because of
an auto folder conflict. I'm not sure what's in your folder, but all things
being equal, try NVDI, drvin, scc, sting (last). What some seem to miss
here is that if you don't correct this, you'll never connect to anything
to create a dns cache file :) CAB/CAB.OVL1.2618 works fine with STinG.
Try my default.cfg changes posted in this NG :).

Merci,

Charles

It will most likely work. I ask because it had problems being on a
"hard disk" with Pacifist, although this is not Pacifist's fault. MWC
is command line driven and the shell makes bios calls which are not
supported on hd emulation. It worked on a "floppy" because emulation
goes down to the bios there. Not surprisingly, I had trouble getting a
32Mb floppy! :-)

>If you really want

Yes, this is indeed appealing. Unfortunately, you are correct, the
functionality is the key issue.

Looks like it's ME then :-(

I can get STiK/CAB/Newsie working a treat, also STiNG/CAB.

Apart from one successful session (or did I dream it?) my STiNG/Newsie
experience has been really bad. Corrupt data, lost messages,
cripplingly slow data rates. I was almost pleased when I saw that John
Rojewski still had work to do on STiNG support, I was able to believe
that all this grief wasn't my fault!

However, it seems I must gird the loins, pick up the shovel and have
another go. If you are getting joy I don't see why I shouldn't!

I run a pretty simple system as I have learned to my cost what a raft
of AUTOs and ACCs can do. I haven't got much there at all. Suppose it
could be worth starting from zero and seeing when it all begins to
fail. The nearest I have to GDOS is NVDI - can't be this, can it?

I have an Atarti SM-124 for sale - best offer accepted - you pay for
shipping if necessary (I'm located in CT near NY)

It was purchased with an Atari ST development system in 1985 - one of the
first...
Extremely clean, rarely used.

>changed the PROTOCOL variable in the DIAL.SCR to 1 ? You're sure you use
>STinG V1.06 ?

Yes, I did. I did click the button, and then I used Edith to manually edit
the DIAL.SCR to 1 to make sure. Yes, I'm using STing V1.06. Now then...
I've managed to connect and stay online now, without my ISP knocking me off.
I had to drop the MTU from 1500 to 576, switch VJ compression to ON, and
activate the Protocol CPX before it would get this far. Still, all is not
right. I use Ping, and it sends out packets (SND LED on the modem flashes
like crazy) but I'm not getting any packets returned...

Any ideas? Thanks in advance...!

2525. Re: New Sting's PPP bombs on me

Newsgroup: comp.sys.atari.st
Date: 1997-08-31 00:00:00 UTC
From: thechyld@pcc-uky.campus.mci.net
Message-ID: <873028580_OASIS_@pcc-uky.campus.mci.net>
Source record: 117701

Okay, I think I'm really, really close now...

1) I'm connecting with my ISP-and staying online-not logging me off...
2) $GET_IP is working with my PPP provider...
3) I can then go to config, find the IP address assigned to me.
4) I can ping that IP address and I do both send and receive packets.
5) I can ping STing's internal address and it works well too...

Now, what version of the CAB.OVL does it take to work with STing? Right now, with CAB 1.5 ('030 version) it bombs out whenever I try to goto any URL with a "CAB.APP needed to run" error message... :(

What other programs (example: Popwatch, IRC, Newsie, etc,...) will work with STing, once I get it right? Thanks in advance...! :)

2526. Fixing the '2 Bombs' problem with STinG PPP

Newsgroup: comp.sys.atari.st
Date: 1997-08-31 00:00:00 UTC
From: asel@stud.uni-hannover.de
Message-ID: <5uc6alqmr1@newsserver.rrzn.uni-hannover.de>
Source record: 117702

Hello everyone,
all you have to do is to load your DIAL.SCR into your favourite text
editor. Now look for the entries called "PAP_ID" and "PAP PASSWORD". All
you have to do is to enter you ID name (eg. asel) and your password:

```
# If you use PPP, your ISP might require password authentication
# via PAP (Password Authentication Protocol). If so, enter here
# the ID ("account", "user name") and the password.
#
PAP_ID = your id here
PAP_PASSWORD = your password here
#
```

And hey! Here we go!!! It shouldn't crash now...

2527. STinG and Geneva

Newsgroup: comp.sys.atari.st
Date: 1997-08-31 00:00:00 UTC
From: pmorales@primenet.com
Message-ID: <5uc7os$l2k@nntp02.primenet.com>
Source record: 117703

I accidentially deleted the original message, but...

Here, running Geneva or TOS 3.06 makes no difference. I don't believe
that Geneva is part of my PPP problem. And STinG/SLIP works great
with Geneva.

Done that for both SLIP and PPP. This setup works reliably (with the occasional hang) using STinG/SLIP. I make a total of two changes to the dialer configuration (to specify PPP to my ISP and to STinG) to use PPP.

From your previous post, I leave compression OFF. My ISP's logon prompts specify a PPP connection, specify in ASCII an IP (exactly the same string as a SLIP connection) and the dialer completes.

Pinging the local address works fine. 100% reliable packet transfer. Attempting to resolve ANY name locks me up.

I don't believe this is a set up problem. Must be a non-compatible ISP.

Thanks for the effort. It really is appreciated!

Yes, I can read this by going into the STing Port Setup CPX and
selecting the appropriate port (in my case, Modem 2).

I've got PPP working, but I don't think this account is using PAP. I
use $GET_IP. So I don't know what to recommend regarding that
problem.

There are plenty of good PD/shareware games to download from FTP sites all around the world. Here's a good place to start...

Hallvard's ST software FTP site:
http://home.sn.no/~hallvart/pages/atari_ftp.html

As for the copy protected games...they cannot work on an emulator because PC's won't even read the floppies. And I wouldn't trust pirated copies to work even on native ST's.

But someday, I hope to write a program to help recitfy the situtation...I just need some more time, expertise, and a good PC :)

Half the problem is typical of all TTP programs, they assume you must be running in some MS-DOS type shell when most normal ST users run it from GEM.

There's a program which lets you pause after you run a TOS/TTP program but I sadly forget what it's called. Terradesk can also let you pause as well, whatever works, eh? :)

Yes, my PAP id and password are in the DIAL.SCR file. I don't
mean to imply that PAP doesn't work, only that I have not been able to use
it successfully with my ISP. I've been very pleased with STiNG and use it
regularly. If I can get this detail worked out it will be just perfect!

The Serial CPX works fine, here, with XControl and ZControl. But, the
STing CPX will only load then save once, with ZControl. The next
load, after a save, will crash ZControl.

This does NOT occur with XControl and did not happen with previous
versions of the STinG CPX. I've moved to XControl for my STinG setup.

You might have moved the file, or reorganized the place from where STinG
loads the STXs, and forgot to move the CACHE.DNS too.

You might also have write-protected CACHE.DNS, which will lead to the same
message.

Nothing ! The script should end there. The Dialer switches the port active,
and the PPP code built into the port driver deals with the "garbage", and
also extracts the IP address.

This is a long shot, but a program called GR Disk Utilities for Windows
(GRDUW for short) makes images of floppies and calls them .dim's.
Windows95.com has a link for this shareware program, but I can't imagine
someone would've taken Atari disks and made PC disk images out of them.

Pray tell why? From what I've seen, pirate stuff is about a
million times *more* likely to work on the real thing too. I've
even seen pirate versions where bugs in the originals have been
fixed!

Source record: 117719

I've noticed on the newsgroup here that several people have had some trouble with the new STiNG PPP protocol. I am one of them. Here's what's happening:

I have correctly setup STiNG v1.06 on my Falcon030 (4M RAM/4.04/530M HD). The only thing that I have in my AUTO folder is HSMOD07 files. The DIAL.SCR is correct. When I load the Dialer, I click on enable, then Connect. The Dialer forces the modem off the hook and dials my ISP. There is a connection made at 14,400. The Dialer runs my script and logs me in. The Dialer tells then tells me that I am connected, and the small window goes away and I am left with the Main Menu of the Dialer. If I try to ping my host the ping does not return. After about 30 seconds or so, the modem will hang up and I get two bombs and my computer is totally locked-up.

I am hoping that there is something that I've missed here, and it's not my ISP. I have been on the Net for about two and a half years, and I've had to use my terminal program and lynx to access everything, since my ISP only supports PPP. Now I've got the PPP protocol (Thanks, Peter!), but frustratingly enough, I can't connect and make use of it! Arrgg!

OK, OK ... something convinced me to grab the files before
they vanish, so I now have all the files from section 11 and
12 of the CI$ ATARICOMPUTING forum, though I have to kludge them
together into one place (section 11 was grabbed with Qmodem at work,
while section 12 was grabbed with Tapcis, a much smarter CI$ aware program).
I will have to write a parsing program to split out the file descriptions
into the individual description for each file that Tapcis does to get them
consistant, but that shouldn't be too much trouble. 1800 files in section 12,
I haven't yet looked into the section 11 stuff yet.

The paper listing I had at work is definitely gone ... I hope I have
the original files on a 6809 Flex disk someplace.

Hallo Peter

I have the same Problems. My script works very well, when i uses SLIP.

Then I change two things in the DIAL.SCR:

The Variable PROTOCOL was set before to 0, I change it to:

PROTOCOL = 1

And my Loginpart was set before to "RESP = Smichael" where the first
Character chooses PPP or SLIP. I changed this to:

RESP = Pmichael

Now i can dial to my Provider. STinG logs in and get a IP-Adress. This
adress is set correctly in the Dialer Window and in the "CONFIG"-Part of
the Dialer.

Now i can Ping to 127.0.0.1 and to my IP-Adress. But that happens all in
StinG internally. When i try to ping to my nameserver, then the
Transfer-LED of my modem flickers, but there are no packets which are
recieved.

What about the DEFAULT.CFG-File in the STING-Directory? Have i to change
some variables there to?

Michael

>I'm getting a "DNS cache load failed" when STinG loads from the AUTO folder.
>Can someone tell me how to fix this?

Da, Da, Da,--- Yo Terry, my posts must not be coming through to your news server ;) Auto folder Conflicts!!! NVDI, blah, blah, blah, then HS7, and STinG last. The only other obvious problem would be not to have the STX's in your STinG folder and have the STinG.inf file set wrong in your Auto folder. I know how you feel as there is a lot of ways to screw up with STinG as it was developed to work with a very WIDE range of Atari setups ;)

Most of us don't understand TCP/IP as well as Peter, and he doesn't understand the confusion that results. He seems to be getting a better handle on the results, however, do to all the posts to this NG :) Hang in there.

Da Da Da,

Charles

This is basically what I am seeing in terms of DIALLER.APP. I think the
bombs are probably caused by STNGPORT.CPX - I have to disable it
otherwise my Falcon bombs out even if I sit in front of the computer
with my arms folded!

Incidentally, have you tried MiNTNet?

>a problem...

and YoYo to you Charles :)

No,I`m not saying that I don`t connect to STOSSER,I do ,and the
address gets shown on the address (?) line,but then I can wait till
the cows come home and get nothing else.Control/K gives no help and
pressing Esc just moves the symbol in the ( ) along. I can get
STOSSER through a link site but of course this takes time and
valuable space. I`m using a STFM (4MB),internal High Dez Drive,ext
DD,switchable 1.0/2.06 TOS,14400 Modem 80MB HD and same software as
you except I think OVL which is 1.25.

The last times I was able to reach the page was to download DIAMOND
ICE and BILLYBOY just about the time of release. Now my STOS box is
getting way behind.

They are created by some disk copying utility and they are just disk
images. Depending on the program, they may be written back to a floppy
or individual files may be extracted. I know no program for Atari that
can extract individual files and the PC ones can do this only from disk
images that comply to the PC standard. Otherwise use either E-copy or
Fastcopy, most probably the images were created with one of them and
they should be able to recognise their own format.

Terry - I know this is not much help, but, I am sure I have seen a PD programme that sits in the boot drive and interrupts Epson/IBM proprinter code and converts it to DJ code to drive the HP printers from LDW Power and such that use GDOS print routines - I can't remember what it is called or where you could get it - that is why I have two printers - my old KXP1124 for LDW and stuff and the HP600 for use with PageStream and That's Write.

I'm sure someone out there will be able to help you !

Hi All,

I have discovered a BIG problem with MagiC and Nemesis on my Falcon.

If I run Nemesis High, MagiC and NVDI together, I cannot print using the
NVDI driver :-(

***** WILL YOU PLEASE TRY THIS AND REPORT THE RESULTS BACK HERE *****

It appears that there is a timing problem with MagiC (according to Titan),
but it is not as simple as that (according to System Solutions).

What worries me is that the two companies will not talk to each other and
sort out the problem.

Your feedback will be most appreciated and I shall pass on all comments to
the two companies.

Yours Roy

2556. Sting PPP setup

Newsgroup: comp.sys.atari.st
Date: 1997-09-01 00:00:00 UTC
From: J.Diertens@Inter.NL.net
Message-ID: <5uf118cvb1@news.Eindhoven.NL.net>
Source record: 117642

Since the end of May I'm using the STinG package to connect my Atari ST to the Internet. From the moment of release I had no problem configuring the program and connecting to my isp. I was glad seeing that STinG now has an option to make a ppp connection and I thought I make that work in just a moment.

Slip and Cslip work fine, without any problem and with all clients. So my basical setup seems okay and I use STinG with cslip on a daily basis.

Changing my Dial.scr to ppp (PROTOCOL = 1 and VJHC = FALSE and a proper ppp loginscript) makes the modem only to send and not recieve anything. The port CPX shows my temporare IP address. Ping 127.0.0.1 gives a good result but anything else failes.

Using the PAP option (with a removed loginscript) results in a few moments of traffic on the modem and then, as soon as I try to make contact (resolve), the modem is disconnected. No IP address is shown in the port CPX. Again ping 127.0.0.1 gives a good result.

My ISP supports all standards and with mintnet I'm able to make a stable ppp connection. I'd rather work not with mint however.

What could it be that I do wrong?????

Further I noticed that the DIALER.ACC changes the dial.scr when saving it, even if no change has been made at all.
The RESIDENT parameter is set from TRUE to FALSE
and the CLIENT_IP is set from 255.255.255.255 to 0.0.0.0
Although I don't think it has something to do with my problem, I think this is strange....
The PAP ID parameter in the config window of Dialer has not enough space to contain my user login (ppp:jdierten@inter.nl.net). I have to edit the dial.scr with an editor to make it complete.
Maybe, Peter, is it possible to expand this item a little?

I sure would like to connect with ppp preferably with pap.
Any tips are apreciated very much.

Regards, Jan Diertens

TM> my Falcon, including formatter, driver, etc.?

All you need is your standard Hard Drive software. I'm told that you won't need to format the drive - lucky really, as when I did my drive originally it took hours!

I currently use ICD's Link software to run it, but you would be advised to use HD Driver (as I'm also told) ICD software causes problems with MagiC.

Cya later, alligator!

For *.DIM files you would need a program called E-COPY to restore them, they
are floppy disk images.

One point for you ;-) and another one against Cops (1.07 here BTW).
Cops inits at boot up *all* the CPXs even those not active (cpz). So another
cpx is responsible but it'll not be easy to find witch one as there are over
60 in the cpx's folder...

Day after day I discover more and more problems caused by Cops...

You know, I'm very stupid. I often move and write-protect files just to see what happens and to be able to complain on something.

Sorry, I couldn't resist.

BTW, I had this message after a reboot following un long connection with a "big" 3 kB cache.dns full of the domains I had reached. I didn't move it or anything else ;-)

2563. Format problems

Newsgroup: comp.sys.atari.st
Date: 1997-09-01 00:00:00 UTC
From: dwmoar@aol.com
Message-ID: <19970901194701.PAA17306@ladder01.news.aol.com>
Source record: 117649

I have a Mega STe with a 1.44 floppie drive. My problem seems to be that it will format a disk about 2/3 and than give me the write protect or a dammage disk error. I seem to be able to write and read from disks that have already been formated HD. The drive formats fine using 720K. Anyone out here, have any thoughts or suggestions. Also I am using the pormat program that is in TOS 2.06. Could this be the root of the problem? Thanks

Helli

I use Pacifist 0.46, and can't print !
I tried to print the docfile of the game Deuteros on Pompey disk 100.
I choosed in printconfig the Centronics port, but there is no output.
And on the desktop when I click on file file and choose PRINT, there is
no output too.
Must I check something special in my bios configuration ?
Or in the pacifist.ini file ?

Help needed ...
Thank you

Well, I thought I was doing pretty good...but I still can't actually get anything resolved. I can ping to 127.0.0.1, and I can ping the IP address assigned to me when I logon, but it will only send and not receive packets from any other address I use...

Question: Has -anybody- actually managed to get STing working via PPP (I know oodles of you have it working with SLIP) with their ISP???? And if so, what programs have you gotten to work with STing using PPP? (example-CAB, Newsie, Antmail, etc,...) Thanks in advance... :)

He's not the only one to use STiNG and NEWSie. I've used SLIP with it for a
the last 4 weeks with no problems. Now I'm trying PPP. PPP seems to work
well with NEWSie and POPWatch, but I've had a couple of hangups while using
CAB (v1.5).

> Why does John reckon he still has STiNG support to do in Newsie?

Good question, there doesn't seem to be any difference between the two of
them. STiNG v1.06 seems to ID itself as STiK v1.06, or rather the transport
layer, reports that in POPWatch.

:) When you save the settings with the CPX where does the sting.prt
file go? It defaults to the last open directory. I stuck it everywhere
that STiNG may look:).

>Also, the values are quit not explicit, example:
>Ip address in a port configuration? what IP address?
>There are tons of address that you can fill up in sting, but none of
>them are really clear.

I have some misunderstanding because he talks about a direct
network connection too. I don't understand all the TCP "talk" so
something in laymen terms, seperating the dial-up type connection and
an ether net connection would make things easier. Especially in the
route.tab docs.

>DNS xxx.xxx.xxx.xxx would be comprehensible.
>Where is the DNS entry? Is that the on called NAMESERVER along with
>DOMAIN? If yes, pliz make it more clear, like a text line, or a
>title there saying DNS entry. Where it shoudl be numerical or alpha.
>

With the old setup, having the route.tab setup properly got my DNS
cache working right. Unfortunately, I don't think now that I am able
to get the route.tab settings right, and settings that rely on that
information to work properly. I guess I could go read some docs on
subnet masks, but i'm not sure which one to use to let the software
know that the IP address will change. Easy enough to setup in the
*.scr file, but not when you have to know a very specific setting in
route.tab.

>Well, that's very confusing, VERY confusing.
>And yet, I am running a full MINTNET+MiNTOS with PPP, and yes, that
>was WAY easy compared to any other stack to set up. Eventhough, you
>have to forget about the GEM interface for the setup.

Show off!:)

>
>Why does the cpx of STING also have the MTU in teh serial part? (the
>one with submask etc).

I think it was suppose to let you reconfigure the *.cfg file without having to go back to an editor. Some have said that using it does delete the *.cfg file they created with a default one, loosing their setting.

>Why does sting has DIALER 127.0.0.1? it's the loopback address, what
>should I do with that?

Opps, he will yell at you for that:). It is in the docs.

>Well in short, STING great, version 1.07 needs to be more explicit
>about things I would guess. Then more users would be able to connect
>painlessly.

I can dial up, get connected, establish a PPP connection, but I never see an IP address in the dialer popup. I don't think that I am setup properly to "capture" the IP address sent from the provider. I should find somewhere, in all the config files, the actual dynamic IP address that was sent, but it is no where to be found. Until this is resolved all I have is a PPP connection with no where to go:).

>
>Peter, keep up the excellent work. (looking forward STiNG 1.07 :))
>
>
>P:S I also get 2 bombs and/or drop the connection on a falcon.

:). If your starting up with the modem off hook, you won't get this problem. You just have to hang up modem with the menu and start over. If you start (as you are) with the proper setup, where the modem is on hook, it will bomb. If I remember right, use the modem.cpx instead of serial.cpx and you can see this. Remember with HS Modem and modem.cpx, the baud setting must use the table in HS Modem docs.

Mike

Yes, that has happened to me too a few times, but not all the time.

> Incidentally, have you tried MiNTNet?

I've tried to install MiNT/MiNTNet several times. Once was the old Distribution kit, once by KG(E)MD, and once by PPPKit. Each time I failed miserably. I couldn't find any help online, and everything got so damn frustrating that I just gave it all up. Don't get me wrong - I'd much rather run MiNT and use pppd or equivalent, but the instructions for the installation of this software is too inconcistant and incoherent.

Are you running MiNTNet successfully? If so, let me in on your secret! ;)

On my TT, I can log on only once per boot.

If I log on, use POPWATCH, NEWSIE, or CAB, and then log off - and then try to log on again. I get through the log on script in my DIAL.SCR file, it counts down from 4 and then blamo! - two, then three bombs and the computer is locked up and the ram is in such a mess that a warm reboot results in being unable to get started. I have to do a full cold boot - turning off the computer and then turning it on again about a minute later - before it will work again.

Normally, if I don't allow it to crash but trying to log on a second time, a warm boot will reset everything so that I can do so.

Anybody else found this?

I had a similar problem with the Atari Compendium CD-ROM. But as in
your case, a PC read it without problems. The solution was to make a
file-by-file copy of the disk...

The 127.0.0.1 port is the internal route of TCP stack it is used on
windows mac and others as the internal route (have a look at the set
up on a windows or NT system the first route address is 127.0.0.1)

>My ISP supports all standards and with mintnet I'm able to make a

>The RESIDENT parameter is set from TRUE to FALSE
>and the CLIENT_IP is set from 255.255.255.255 to 0.0.0.0
Client IP in PPP is not needed as it is supplied by the ISP when
connection each session.
This 255.255.255.255 is the number of the subset mask and is not
needed. the ROUTE.TAB should look as this
0.0.0.0 0.0.0.0 port name 0.0.0.0

Although I don't think it has something to do with my problem, I
>think this is strange....
>The PAP ID parameter in the config window of Dialer has not enough
>space to contain my user login (ppp:jdierten@inter.nl.net). I have to

Forget the PAP ID anyway it would only be your user name eg *jdierten*
and your password for your mail account (not your dialup sword:)

Brian,

Thanks for the information, I believe I've seen something similar,
although I wasn't aware that it was for GDOS output - I'll try to find
it again!

Thanks,

Terry

Hi Ronald,

I'm using STinG/PPP with Newsie & CAB 1.5. So far I've used STinG
successfully with slip, cslip, and ppp. I'm in a minimal configuration
which most of the time is a pain, but perhaps it has certain benefits
too. Since I'm trying to cram everything I need to boot up with onto
one 720K disk, it's relatively easy to keep track of what I've changed
recently if an application starts to misbehave.

2581. A couple of questions

Newsgroup: comp.sys.atari.st
Date: 1997-09-01 00:00:00 UTC
From: Ross Purves <ep111@city.ac.uk>
Message-ID: <Pine.GSO.3.95.970901234727.15959B-100000@euston>
Source record: 117667

Although I have often read this group, this is my first submission. I have been a dedicated Atari user for many years and was hoping for assistance with two matters. Firstly, As part of my degree, I am currently conducting research into the use of parallel processing (connectionist computing etc) to model musical inprovisation. I therefore require development software to complete this research. I was wondering whether anyone knew of any parallel processing simulation software available for the st range of computers.

Secondly, in pursuit of the above task, I have been spending longer and longer in front of the computer lately and have experienced marked visual impairment as a result (eye strain, mild double vision, focusing problems). Has anyone experienced similar problems using the Atari ST? In particular, whilst using the SM124 monitor or similar. If so, are there any tips that could be pasted on??

Thank you,

Ross Purves

2582. Hard drive operation

Newsgroup: comp.sys.atari.st
Date: 1997-09-01 00:00:00 UTC
From: ai063@FreeNet.Carleton.CA
Message-ID: <5ufjol$9ad@freenet-news.carleton.ca>
Source record: 117668

What is the better method to run hard drives: turn them on once a day
and let them run 10-12 hours or turn them on and off as required?

In the "old days", a few years ago, it was thought to let them run
all day because the startup torque put so much strain on the
bearings. Today's HDs are so much smaller and lighter that they run
up rather quickly and with probably less strain on the bearings.

Is this a problem any more?

2586. Re: STiNG 1.06 PPP login...

Newsgroup: comp.sys.atari.st
Date: 1997-09-01 00:00:00 UTC
From: Katherine L Ellis <kellis@primenet.com>
Message-ID: <Pine.BSI.3.96.970901140313.13004A-100000@usr03.primenet.com>
Source record: 117672

Hi, Well obviously, there are problems with STiNG.
1) the most obvious to me is: the installtion (eventhough, GEM-driven)
is quite hard, because the user interface is not really well designed.

Example, useage of cpx, mixed with a dialer, with at least 2 or 3 ways
to change the same parameter, MTU for instance, or serial port. (at
the end, I don't know which one will be valid).

Also, the values are quit not explicit, example:
Ip address in a port configuration? what IP address?
There are tons of address that you can fill up in sting, but none of
them are really clear.
DNS xxx.xxx.xxx.xxx would be comprehensible.
Where is the DNS entry? Is that the on called NAMESERVER along with
DOMAIN? If yes, pliz make it more clear, like a text line, or a
title there saying DNS entry. Where it shoudl be numerical or alpha.

Well, that's very confusing, VERY confusing.
And yet, I am running a full MINTNET+MiNTOS with PPP, and yes, that
was WAY easy compared to any other stack to set up. Eventhough, you
have to forget about the GEM interface for the setup.

Why does the cpx of STING also have the MTU in teh serial part? (the
one with submask etc).
Why does sting has DIALER 127.0.0.1? it's the loopback address, what
should I do with that?
Well in short, STING great, version 1.07 needs to be more explicit
about things I would guess. Then more users would be able to connect
painlessly.

Peter, keep up the excellent work. (looking forward STiNG 1.07 :))

P:S I also get 2 bombs and/or drop the connection on a falcon.

From Delphi's Jim Collins (chro_MAGIC):

Hi All,

I have an update on the English version of CAB 2.5 - the HOPED for
release date is "the end of August" - this is for both the full CAB
2.5 release and for the CAB 2.0 -> 2.5 upgrade kits. Please bear in
mind that this "hoped for" date is when it will hit the street in the
UK, it will take another week or so to get to the United States.

Of course chro_MAGIC will have both the full version and the upgrade
kits available just as soon as they arrive from the UK.

Oh yeah, CAB 2.5 will cost more than 2.0 - and 2.0 will continue to be
available for those who want to use STiK and/or don't need PPP.

... This is the end of the past, but the future has barely begun.

Who knows...the only pirated games I have personally seen were at a friend's house who has a large collection of ST games. I look at some of them, just to see what the game's like, but mostly they wouldn't load. Of course, now that I do think back...it could most likely be the disks have bit rot(his collection is quite old).

So my previous statement could very well be wrong. Ah-ha, and you guys thought I'm perfect! :)

Now loading up his spell checker...

>> complete the process?
>
>Nothing ! The script should end there. The Dialer switches the port active,
>and the PPP code built into the port driver deals with the "garbage", and
>also extracts the IP address.

Okay, this is gonna sound funny now, but here goes... My ISP dynamically
allocates my IP address, I.E., I don't have a fixed address. If I leave out
$GET_IP, it does not ever logon correctly, and my ISP dumps me in about 2
mins. flat. If I use $GET_IP, it now logs me on correctly, and I'm able to
ping, etc,...so whats going on here?

I'm really getting confused... :^)

2596. STinG FAQ

Newsgroup: comp.sys.atari.st
Date: 1997-09-01 00:00:00 UTC
From: Terry.May@rebel.ronly.org
Message-ID: <a67_9708312207@ronly.org>
Source record: 117724

I did read the STinG FAQ when first setting up, but at the time it was all foreign to me, so it didn't all sink it. I just read it again and feel like an idiot for asking stupid questions that were covered in the FAQ. Sorry about that, Peter and the gang. :^)

Here are a couple things that seems to have slipped by quite a few of us:

A: Follow closely the instructions in ESTABLISH.TXT. You'll need your own IP address, which will be assigned by your ISP. Do not choose one ! The ISP either gave you a permanent address, or you'll get a new one each time you log in. In the latter case you must edit a dial scriptfile, to tell the Dialer how to fetch the address at login time. If you use PPP, IP addresses are negotiated automatically.

(That last point is especially worth noting!)

Q: I can't get the f..... 'STinG Port Setup' CPX to show me the port which I selected earlier, when I get back to it.

A: That's just normal, and intended. Note that CPX is not meant for selecting any port. It's just there for providing a means to configure ports. By choosing a port from the popup you merely choose the settings of which port to edit, you do not choose which port should be active.

(There's been a lot of traffic here on this topic.)

>The MFP only seems to accepte 9600 or 19200 bauds and nothing in between

There are only 'standard' baud rates available & 10000 is not one of them.

You may be able to get this with a software trick (MFP) but I don't know how.

The only sure way is to change the clock going into the MFP to a frequency
that will give you 10000 baudout when you select '9600' in the control panel
(or other software).

Why do you want 10000 baud?

Okay, I can logon, connect at 28800, grab the IP address, negotiate PPP, and stay online. I ping 127.0.0.1 or the IP address assigned to me at logon and all packets are sent and returned with no errors. If I try to ping anyone else though, the send light on my modem flashes like crazy, but nothing is returned. I can't resolve anything either-I always get "unable to resolve domain name" errors. Here are my DEFAULT.CFG and DIAL.SCR...Can anybody tell me what is incorrectly set? Thanks...!

Its not any of the following:

1) MTU-anything other than 576 and it won't logon.
2) PAP-My ISP does do PAP-CHAP, but not regular PAP.
3) My ISP dynamically allocates a different IP address
at each logon, so CLIENT_IP is out.
4) I have to use $GET_IP-it works-it graps the IP address
assigned to me for that session. If I don't use it, my
ISP logs me off in 1-2 minutes...

2609. New ST User Needs Help!

Newsgroup: comp.sys.atari.st
Date: 1997-09-02 00:00:00 UTC
From: Jill Howe <howej@sunyit.edu>
Message-ID: <Pine.HPP.3.96.970902165942.22980C-100000@demeter.sunyit.edu>
Source record: 117587
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.advocacy,comp.sys.atari.programmer,comp.sys.atari.st

I got a bare-bones 520ST about a year ago, with one boot floppy, no manuals and no HD. Due to the scarcity of help and software, I'm on the verge of selling the system. Can anybody provide me with:

* The most modern OS that will work well on a 520ST. Remember, I don't have a hard drive!

* A decent terminal program so I can get the ST on the net (Zmodem download would be needed).

* Manuals? Any old pro out there who no longer needs to refer to their 520 ST manuals? Even photocopies are welcome.

* Pin-outs and or manual for the color SC1224 Atari monitor.

* Music software for a MIDI keyboard (this is why I got an ST).

Thanks,
Jill

2610. STING and PPP: the final answer ?

Newsgroup: comp.sys.atari.st
Date: 1997-09-02 00:00:00 UTC
From: rgronoff@NO_SPAMimaginet.fr
Message-ID: <5ui3us$c7e$1@belzebul.imaginet.fr>
Source record: 117588

Let's face it: STING doesn't work. So, what's the solution ?
My opinion: to be brave enough to call it a crap programme, erase
it from your HD's, forget the name (gives bad blood circulation)
and *warmly* support Dan Ackerman and Steve Adams who gave us the
ONLY internet connection program that works: STIK, so that they
can cook us a lovely working PPP version of STIK (v1.14 ?)

2611. Re: STing...Not...

Ronald J. Hall (thechyld@pcc-uky.campus.mci.net) wrote:
:
: Question: Has -anybody- actually managed to get STing working via PPP (I
: know oodles of you have it working with SLIP) with their ISP???? And if so,
: what programs have you gotten to work with STing using PPP? (example-CAB,
: Newsie, Antmail, etc,...) Thanks in advance... :)

I have STing connecting vit PPP and have successfully used all of the the STik software that I have, namely: CAB 2.01, Newsie 0.80, aFTP 1.3b, and Tel VT102.

Regarding two bombs after connection with a Falcon: for me this never happens the first time I dial and connect, but always happens the second time.

Regarding use of Van Jacobsen Compression and PPP: I tried this, but for me it didn't work too well. Data transfer dropped way off. Peter posted about this earlier saying some people had good luck with it set on, other had better luck with it off, I'm one of the others right now.

Regarding speed of data transfer: I get good data transfer, perhaps a bit faster than I had using STik. I noticed sometimes the data transfer counters seem to stop momentarily, but I think now this is soemthing to do with the program updating the display, as usually the transfer spins abruptly forward afterwards, and then continues on at regular speed, so that over all speed is pretty consistent.

Regarding using STing with Geneva: It works fine with me. I was getting an AES error message when exiting the Dialer, but I realize now this is being reported by NeoDesk, not Geneva, and NeoDesk has an option to suppress this message, which I am now doing (Peter says this message is an unneccesary nag, so I feel justified in suppressing it, I'll have to dig out my NeoDesk manual and remind myself why Dan Wilga put this feature into NeoDesk again).

: file, it counts down from 4 and then blamo! - two, then three bombs
: and the computer is locked up and the ram is in such a mess that a
: warm reboot results in being unable to get started. I have to do a
: full cold boot - turning off the computer and then turning it on again
: about a minute later - before it will work again.

I have exactly the same experience with my Falcon, and have reported it
in this newsgroup many days ago. The only difference being that a warm
reboot always suffices to restore things, and I can use the alt-ctrl-del
keys for this reboot (someone else posted to this newsgroup with the same
systems you and I have, with the added inconvenience of having to use the
reset switch to reboot).

STing always works on the first try, and never on the second ;-)

Hmm. What is odd about the way it looks? Certainly you'll want to run a desktop with it, like NeoDesk, or Thing. Then everything looks exactly as usual, except the desk menu now lists all the programs that are running in addition to all the desk accessories that are running. Visually, what could be more normal?

Sure, you _can_ dink about with gadget sizes, alternate fonts, and underlined key equivalents in menu boxes, make button always look 3D (instead of just on newer programs) or have rounded button corners or whatever, if you want! But all of these adjustments can be turned on and off.

Is this really TRUE???

I have to open STiNG Internals to make STiNG work.

If the CPZ was init. at bootup I wouldn't have to do this, surely?

I am using COPS 1.06 and I call it as an APP rather than starting it
at boot but I still have to open Internals.

Agree. I use it all the time. But if I had owned anything else than a Falcon and didn't care about MiNT, I'd go for MagiC. It's fast and slick, and quite stable.

Geneva is also very good, and can be used together with MiNT (Although I've never been able to do this for more than a few minutes...). It's very stable, extremely easy to install and use and perhaps the most compatible multitasking OS for Ataris. The downside is that it looks a bit odd...

Yes. I can use PPP with zetnet ISP with Newsie 0.80 and CAB 2.0 as
clients (the only ones I use).

STiNG had been giving me trouble even with SLIP but it looks as though
a lot of this was down to me fiddling with its CPX when I should not
have done!

To get round this I re-installed the CPXs and restrained myself from
messing about with anything other than "Internals" and "Serial".

My swop to PPP was easy - just put in the PPP identity and password,
clicked PPP and removed the $GET_IP logon line using the Config menu.
I saved this to a different, file PPP.SCR, so when I want to use PPP
(and I still am not sure WHY I should!) I open DIALLER, go to Config,
click on the top line, select PPP.SCR and click "Accept". Then it's just back to
"Enalble"/"Connect".

csilver@kendaco.oN.telebyte.mapS.com (Charles Silver) said:-

>Hi Ronald,
>
>That's just par for the course. Question, what's your FIND statement?
>Does your ISP use PAP protocol? If so, do you use your e-mail password or
>login password in the PAP statement in your dial.scr?
>---
>Not confused here <g>,

Okay, the confusion is coming from the fact that half the replies say do NOT use $GET_IP, and the other half say, do use it. ??? <smile>

Here is the login part of my DIAL.SCR...

```
DIAL_SCRIPT
#
WAIT =
REPT =
FIND = CONNECT
RESP =
WAIT = 500
REPT =
FIND = login:
RESP = thechyld.pcc-uky
#
WAIT = 500
REPT =
FIND = Password:
RESP = MYPASSWORDHERE
#
WAIT = 750
REPT =
FIND = Option:
RESP = P
#
WAIT = 500
REPT =
FIND = to
RESP = $GET_IP
#
```

This works fine, as far as logging me in, getting the IP address, and then negotiating PPP just great. I've not been able to get one app to "resolve" though...Antmail, Finger, Cab, etc, all quit with an "unable to resolve

hostname" error. I can ping 127.0.0.1, and the IP address thats shown in under Config just fine with no dropped packets... STing is picky too, I have to reboot after each logon session, otherwise it won't logon correctly. Also STing slows down Oasis and CoNnect when I use them after STing. (way down)

Thanks for your reply, and I'm glad you are not confused...! :)

2624. Help: Notator 3.xx printing at 600 dpi

Newsgroup: comp.sys.atari.st
Date: 1997-09-02 00:00:00 UTC
From: Paal Monstad <pmonstad@online.no>
Message-ID: <01bcb709$921b90c0$LocalHost@default>
Source record: 117789

Is it possible to get Notator 3.xx to print at 600x600 dpi to a HP laserjet 5 and 6 printer?

2625. Ultimate Virus Killer 7.1

Newsgroup: comp.sys.atari.st
Date: 1997-09-02 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.090297.142329.51@wxs5-7.worldaccess.nl>
Source record: 117790

```
This message is meant to make you aware of the recent release of version 7.1
of the de facto industry standard Atari ST/TT/Falcon virus killer, the
"Ultimate Virus Killer". It is available, together with the next version (which
will be sent after it's finished, which will be in December somewhere), for US$
15 or 10 British pounds (no other currencies, please, and cash only, no
cheques).
If you have additional questions, please email me at the email address below.
If you want to go right ahead and get the latest version of "UVK" and become a
registered user, send the money to the snailmail address mentioned below.
Thanks!

Body handling: HTML body converted to readable text

Thanks to those who responded to my previous posts,
my MEGAFILE is now sold! ;-)

The following items remain FOR SALE/TRADE:

* 4160 STE (TOS 1.62, 4 Mb) ==>> ie: 1040 STE @ 4 Mb

* MEGA-ST 4 (TOS 1.04, 4 Mb)

* SLM 804

* STM 1 Mouse

* Softwares

DTP: Timeworks - Publisher

Soft Logic - Publishing Partner

Music: Dr.T - D-50/D-550 Editor

Dr.T - D-10/D-110 Editor

C-Lab - Notator SL 3.1

Offers within Canada / US only! Will sell to best offer, or trade
(individual items or whole package) for either of the following:

Wanted
------
* MEGA-STE (TOS 2.06, 4Mb Ram, Internal HD)

* STacy 4 (TOS 1.04, 4Mb Ram, Internal HD).

* Crazydots-2 graphic card for TT (or equivalent ET-4000 card)

NOTE: Canadian banks cause troubles for cashing foreign currency
of any kind, including American. This can be avoided by an
electronic fund transfer (Western Union or similar), which
is usually cleared within 48 hours of transaction.

Nonetheless, if you're interrested in trading your MEGA-STE
or your STacy, we can arrange something, as no money would
be trading hands accross the border.

Complete list of items I'm selling or looking for on my homepage.

From: Greg Malick <tiger@hgea.org>
Message-ID: <340C2BA8.1E1@hgea.org>
Source record: 117800

Aloha,
I have a Atari mega-44 removable HD cartridge. It seems to have bit the dust, just can't read the syquest cartridges anymore. I opened it up and there's an ATARI DMA/SCSI converter board inside.
Here's what I'm thinking:

1. Could I pull out the Syquest drive and replace it with a SCSI ZIP drive? (One of those internal jobs; they run about $125.00 & disks are cheap)
2. I'm using AHDI.PGM Do I need something else to format the Zip drive?
3. If I did this, could I boot from a Zip disk?

For more major money I could go to the JAZ or SYJET but I don't want to invest that kinda money for the drives or disk. I don't need that kinda HD space for the Atari, anyway.

Thanks in advance,
Greg Malick

Source record: 117801

PLEAS, PLEASE, PLEASE, IS THERE ANYONE OUT THERE WHO CAN HELP

I apologise for the error in my original request for info.
The Power Computing RAM Upgrade Board (apparently made for them by Gasteiner!)
plugs into the SHIFTER socket not the MMU.

From what little I can find out the Shifter Chip should be plugged into the
Upgrade Board but:

a: It isn't! I can't see it anywhere on the Motherboard!

b: I get colour graphics on my CM8833 Colour Monitor! How?

The upgrade board is "L" Shaped and contains 4 Soldered RAMS (DRAMS?) marked
with "D424400V-70; 9106FU003; NEC JAPAN".

It also holds 3 "224"'s coloured blue and an "HI-Q 16V 100???"

The program "FREERAM.TOS" shows:

Total Memory 2621440 bytes

Free Memory 2519104 bytes

Used Memory 102336 bytes

This was with nothing else in memory.

Can anyone out there give me any info on the upgrade board, chips, circuits,
etc?

or

Where approx 1.4meg of Memory may have gone to??

I am in my 50's but enjoy "playing with my Ataris"!

Will someone please help?

Hoi,

Which CD-ROM driver are you using? My guess is you're using extendos.
I've had simulary problems the time I was using extendos. Since I'm
using Metados (or Spin when I'm working with MiNT) again I don't have
these problems anymore.

Hope this help

Get a standard PC 1.44 drive. It will work with a few modifications.
Read the Quick FAQ (below), and follow the links about changing the
floppy disk drive

I don't know the device but I don't see why not.

The problem may be with SCSI IDs. Some host adapter boards would only
support ID 0 or ID 0 and 1. The ZIP, IIRC, can only live at ID 5 or 6.
Unless someone else know chapter and verse on the h/a you could only
test it by attaching a device with variable ID and then see if the h/a
will support it for ID 5 and 6.

If this all works you should be able to use AHDI (or anything else for
that matter) and , yes, you can boot from a ZIP.

From: markh@cts.com
Message-ID: <340c7643.100762@news3.cts.com>
Source record: 117807

Please help a fellow Atarian.
I have decieded to upgrade my MegaSTE from 1 to 4 Megs. So I
bought 4 - 1 Meg 30pin SIMMs. They are 60 ns which should be more than
enough. They are the 3 chip (1x9) design. AFAIK, since Atari
computers don't have parity memory checking, the parity bit should be
ignored.
So, I installed the new SIMMs then powered up. The computer
acted as if there was no memory in it at all. I didn't even get a
start up screen with the Atari logo. Then I reinstalled the oringinal
256K SIMMs and everything was fine.
So, could somebody tell me if parity SIMMs are incompatible
with Ataris?
Or, I noticed a bank of 8 dipswitches next to the TOS chips.
At this moment, only switch 7 is switched on. All the others are off.
Do I need to flip one or more of these to make my MSTE recognize the 1
meg SIMMs?
The owners manual was no help. I hope someone in this
newsgroup can be.

TIA,

mark

On the subject of a PC copying ST disks, try VGA Copy 6.23 ! It copies 1 in 2 disks into image files which have to be unpacked and renamed to .ST files - but they work OK under Pacifist.

Try: www.fatal-design.com/desktop for more information and/or their ftp site (ftp.fatal-design.com) - the program is in the pub/PC section.

I don't know about that, but there is a hardware device, called Mouse Master,
that allows you to plug in your mouse and two joysticks, and switch between
mouse and joystick for Port 0. That way you never have unplug your mouse to
use a joystick in Port 0.

Could someone who has used both systems give me some advice
which to chose??? I would like to set up one on my TT (4+4)/(10/16)
system.
I don't want to start a flame war, just need to know the pros and cons
of each.

Boris

Message-ID: <873160376_OASIS_@pcc-uky.campus.mci.net>
Source record: 117817

I've discovered that not only is STing a little slow-it also slows down any other comms. programs on my Falcon. Using Oasis, I reliably get 2500-2700 cps downloads from ftp sites. With STing running from the Auto folder, this drops down to 1500-1700 cps... Similiar results happen with CoNnect... Any one have any idea what is causing this? Thanks...

: Does anybody know anything about this soft or an alternative to it?

Hmmm the only OCR software for the ST I know of is Migraph's commercial OCR program, and OCR v1.4 which is a freeware program available from most software archives.

Based on my own trials I've found that OCR software has a huge problem with recognizing handwritten information. Even proper type can be difficult if the software hasn't been trained to recognize a similar typeface.

Hope this helps...

Hi Ronald,

That's just par for the course. Question, what's your FIND statement?
Does your ISP use PAP protocol? If so, do you use your e-mail password or
login password in the PAP statement in your dial.scr?

Not confused here <g>,

Charles

What I mean is my setup bombs out soon after booting even if I make no
attempt to connect or do anything else with the computer!

>
No secret, I started with the TAF distribution, which worked but was not
practical with X and Chimera on a 4MB machine. I then looked at the
PPP-Kit distribution, but decided I liked a full Unix system so went for
KGMD/KEMD instead.

Basically I run MiNT "behind" GEM, not MultiTOS. I launch PPP.TOS
(which is a link to pppd) by clicking on its icon from the desktop.
pppd looks at /etc/options for most of its instructions, including
connect and disconnect scripts, whcih in turn link to chat scripts.
Incidentally, the only "network" parameter in this file is "mtu 1500".
The only parameters held outside the options file are:
1. I set the port speed via the modem CPX as pppd does not appear to
support 57600.
2. The nameserver address is stored in resolv.con.

I can then launch CAB/Newsie as desired and all works perfectly - solid
as a rock!

I once started to put together a really minimal PPP-kit, but couldn't be
bothered to keep activating and de-activating AHDI to boot from floppy.
The idea was just to copy a folder or two from the floppy to the hard
disk. Instead, I will probably set up something on my newly-acquired
website to show how my setup works. Then it will be available to all :)

Regards,

Ian Smith

2658. Understanding STinG

Newsgroup: comp.sys.atari.st
Date: 1997-09-02 00:00:00 UTC
From: csilver@kendaco.oN.telebyte.mapS.com
Message-ID: <5ugm5q$kq4$1@brokaw.wa.com>
Source record: 117823

Hi Kemosabies,

Well, thanks to Peter's recent prolific posts, I now have a much better
understanding of how STinG works, esp. all the CPX's. I no longer get
any bombs or crashes messing with the setups. I decided to take a "reasoned"
approach to get STinG to work with ppp rather than using so much trial and
error trial <g>. Here it is for all to see...

1) I have STinG v1.06 working with a static IP SLIP account. Therefore I,
assume my default.cfg is OK. No changes there.

2) In my SERIAL.CPX it's set to 115.2k/8/none/1, Flow Control=None.
Same successful settings using my SLIP account.

3) My ISP says they use PAP protocol. I must assume that this is a true.

4) When using a terminal prg., It never mentions my Dynamic IP address,
and yes, I am suppose to have a Dynamic IP. Therefore, using $GET_IP
is useless as the dial script won't get it...

5) While watching my login/password being collected with the dial.scr
no other info is being collected after login is completed as the
modem lights are silent after connecting. This ISN'T the case if
you use a terminal prg. as the binary ppp info comes in AFTER login/
password/connect is completed. This I assume is the case for others
using a ppp connect. Right?

6) After waiting 30 sec's or so I checked the Dialer's conf box and then
the Port Parameter's. My IP address is stated as 127.0.0.1, so since
this is obviously incorrect, I must assume that my problem lies in
my dial.scr. (127.0.0.1 is being defaulted from the default.cfg)

7) The Port Parameter correctly checks PPP, so I assume that my dial.scr
and login/password is correctly getting my PPP (trial) account,
not my SLIP.

8) Someone posted that you should use your e-mail password in the PAP
settings, not your login password. This is a bit troublesome as the
ISP never mentioned this. I tried both, neither worked.

9) In my dial.scr I've tried IP_CLIENT as 0.0.0.0 or nothing. No help.

10) I think the problem lies in getting the server to send me the PPP
code automatically after login and for STinG to decode it. That
simply isn't happening.

11) I can't think of changing anything else in my dial.scr, so I'm
stuck on getting online with STinG/ppp unless I get some more info ;)

That's the long and the short of IT! Can anyone give me a few pointers here? I guess that there could be an ISP problem, as I have a trial account, and something could be incomplete, but I'm open to comments...

Regards,

Charles

I used my SLIP config as a basis for the PPP config and had to remove
the $GET_IP part of the logon dialogue. PPP seems to do this
automatically - if you leave $GET_IP in there it will just hang as
there will be no response.

To create and view web pages locally you just need a decent text
editor (say EVEREST) and the CAB browser (say v1,5) - both are freely
available.

If you want to browse pages on the net you will need either STiK or
STiNG to connect to your ISP. I would recommend STiK at the moment as
even Atari greybeards are having problems with STiNG.

Sounds like the A;, B: are not installed in the DESKTOP.INF file of
your floppy or partition C: of your HD.

If there is a DESKTOP.INF on your floppy you have in at boot-up,
delete it! Boot again - you should see A: and B:. Do "Save Desktop".

This is why I'm confused...if I take $GET_IP out of my setup, it will NOT
find an IP address and it hangs there, and in about 1-2 mins. my ISP logs
me off... I have to use $GET_IP to logon...whats the difference??? :)

2666. ULTIMATE VIRUS KILLER 10TH ANNIVERSARY (EDITORS TAKE NOTE) !!

Newsgroup: comp.sys.atari.st
Date: 1997-09-02 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.090297.143233.49@wxs5-7.worldaccess.nl>
Source record: 117831

This message is directed at all of you out there who are editors of regular computer magazines, Atari magazines, Atari club 'zines, the works.
On December 12th 1997, it will be exactly 10 years ago that the first version of the "Ultimate Virus Killer" was released (even though at the time it was still known as "Virus Destruction Utility"). I would like this day not to go by unnoticed, so I would like as much press coverage as possible, most particularly in whatever issue you are releasing around the beginning of December. I am thinking of feature articles, a history of viruses on the ST, and possibly stuff on a cover disk (if there is one). In the latter context I am thinking of a demo version of the virus killer (I could make a preprod demo version of 8.0 well before December 12th), or a new version (updated and enhanced) of the "Ultimate Virus Killer Book" 'on disk version'. Reviews would also be much appreciated, although the anniversary version won't be finished until December 12th so you'd have to make do with version 7.1 that I finished about a week ago.
I would also like to do something in the order of "UVK" discount offers for your readers or club members. Please contact me for details in case you want to undertake something.
I don't want to do things twice and I would very much like to prevent two identical articles from appearing in two different magazines, unless they're published on different continents or in different languages. Stuff planned so far includes an "X-Files"-style history of viruses on the ST for "Atari Computing" in the UK and something similar for a German magazine (in German).
I am available for any information you need, and also for interviews if you think that's a good idea. If you want me to do anything special (custom "UVK" demo versions, etc.), please make me aware of the deadline of the issue that's closest to early December so I know when to do stuff at my side of things.

OK,
Here is what my STinG/PPP setup looks like. Sorry the file is so long,
I just wanted to include everything- I've tried to format it so it takes
up a minimum amount of space.

I'm using a 1040STe w4 megs, no hard disk, a single 720K drive, and
a 14.4 modem.

```
--------------
ROUTE.TAB
0.0.0.0 0.0.0.0 Modem 1 0.0.0.0

2671. Re: Geneva vs. Magic?????

Newsgroup: comp.sys.atari.st
Date: 1997-09-03 00:00:00 UTC
From: greg_evans@delphi.com
Message-ID: <5RTgIxv.greg_evans@delphi.com>
Source record: 117536

I have both Geneva/Neodesk and Magic/Ease, latest versions of all.
My preferred setup is G/N. Overall it seems to be more intuitive
than M/E. Magic is faster launching and exiting programs, but
doesn't have some of Geneva's user friendly features. Magic is
also probably better for multitasking heavy duty programs as you
can be sure each program will get a piece of CPU time. I find
geneva more compatible however the times I need to _really_
multitask, as opposed to just having multiple programs running
where I can switch between them are rare but Magic works better in
those cases. ease is very slow at startup. On my system is taking
more than 3 minutes from boot up to desktop. Hope this helps
a little...

: To be a bit harsh, this seems to be yet another propeller-head program for
: Atari. Lots of tech mumbo jumbo, and very little for an ordinary user.

You wouldn't say that if you were one of the legion of users who can't get SLIP access from their local ISP. For them, the fact that STing has PPP makes it very important.

: Plug-and-Play is far away.

But closer with STing, as STing supports PAP and CHAP. Also, the new dialer allows you to enter all parameters in a nice wizard environment, rather than using an editor (although that's not so bad either).

I have yet to see a simple implentation of dial-up on any platform. There are jsut too many variables involved because ISP's implement things in so many ways. Yes, if you are connecting with PAP, in theory you can get away with just entering you username and password, plus the phone number to dial. (maybe your DNS as well, I'm not sure if this is redsolved automatically or not). Just as with the Win95 dial-up. But for me, this utility was useless, as my ISP needed some dial-up scripting. I had to download a special utility from MicroSoft, edit a text file, etc... At least as hard as the STing set-up. And the documentation was horrible.

: Don't EVEN call it DOOM! (I hope I'm wrong and that there is a playable
: DOOM for Falcon somewhere.)

No, you're assuming that William has given another URL for BadMood.
Actually, this points to a page that actually has Doom for the Falcon.
The iD game Doom. Ported by "Lord Chaos." I haven't tried it yet, but it
has been mentioned earlier in this thread as being the original cracked iD
code compiled for the Falcon, but not tweaked in any way so too slow to be
fun. I'll have to take a look at it myself.

I believe that that is your problem right there. I have a TT with a
similar response to 3 chip, or composite SIMMS. You need to find some
of the older 8 or 9 chip SIMMS for the Atari to recognize them.

You would need a really patient hacker to take the program code apart line by line: it would take months.

Best solution is to try a dual-processor setup likethe PAK30 board with the optional 8mHz 68000. has anyone tried this and been able to run Notator after such a modification?

I'm shouting into the void: MIDI people hardly ever read newsgrious as they are too busy making music.

No.

Have you tried all simms/socket combinations?

Are the simms are o.k, can you get them tested?

Are you sure they are 1 meg simms, could they be 4 meg?

I also don't understand: are you need something fo score DTP or MIDI-recording with score editing?

I have file called NOTATION.HTM (78,5Kb unpacked size)from Dennis O'Neill (demo@scubed.com).
You're find it onto his www-page (archivename: music/notation-pgms)
This excellent created catalog contains needed data about a lot of score DTP/notation software for ALL (really!) platforms and OSs.
Prices and info about developers/distributors also are included.
It's cool!!!!

Email to mr. O'Neill or me (I also can send to you this LZH-packed file 20,8Kb size).

As for me I using NOTATOR SL v3.1 from Emagic (formely C-LAB) during 5 year not only as sequencing software but for score DTP too. It's a nice program!
Alternative software: CUBASE v3.xx from Steinberg/Jones.

Also highly recommended the LOGIC latest version for ATARI - 2.1 (AFAIK). In my opinion it's a most powerful pro level sequincing/notation/digital audio recording software on the market. It is my personal opinion, underline! The LOGIC is a single object-oriented program package which I know for music/MIDI application. Now available also for PC. Version for MAC is presented too.

The LOGIC is very cool, but some expensive.

I hope that help you.

Have you looked inside the tin shielding box on the PCB, the shifter lives
inside here. It is also soldered in on some ST's.

Gerry thanks for the help, unfortunately for me!, we are talking about the ame location,
"A Rose by any other name!"

As I understand it the shifter is removed (unsoldered?), a socket (AU6AT4)
is soldered in the shifters place, the upgrade board is plugged into this
socket, then I assume the shifter chip should be plugged on top.

But, it isn't!

Well, I wouldn't. It shouldn't hurt to put in your login/password. Question
is which password. E-mail or login? Not sure on this as I've heard some say
one or the other ;(Obviously, one is right and one is wrong...

No big deal here, it depends on your ISP login procedure.

```

> Okay, thats it! Any and all help would be appreciated...! :)

I wasn't sure if I should post this as I can't get my ppp/IP with STinG.
It just may add to confusing people. So here are some caveats:

1) This is a big one. If you change anything in your default.cfg, those
settings aren't changed unless you re-boot. This isn't the case with
the dial.scr. If you log off, then re-dial the new settings are now
used.

2) The default.cfg settings I mentioned work very well with STinG/slip.
SO, be aware of this.

3) As many have mentioned, I don't save any CPX settings other than
SERIAL.CPX. If you do you can get bombs if not done EXACTLY correct!
I just activate the SI.cpx before login on or after re-boots ;)

4) I'm only responding to this because Ronald was kind enough to
post info to some of my posts and the off chance it may be of
some help to others...

BYE, bye,

Charles

2682. video poker

Aloha all Atari enthusiasts!

I've been searching high and low for a 'video poker' game for the atari. I have been to most of the ftp sites. They all show a listing, but none of them are complete files. What am I missing here?

If someone has a 'video poker' shareware, or know where I can get a decent priced software for this, I would really appreciate it.

Thanks a bunch!

> drops down to 1500-1700 cps... Similiar results happen with CoNnect... Any
> one have any idea what is causing this? Thanks...

Well, there is a slider in one of the CPX's that sets the "system load".
It seems to somehow be related to speed. The documentation however is
extremely unclear on this. It only says that if a certain setting affects
the system one should set it higher. Not a word on what kind of
performance of Sting or otherwise is affected by these settings.

I'm running Sting succesfully, but I'm not at all sure if there is any
actual advantage compared to StiK. Sting does work in PPP, but what does
that mean to me? My provider offers both PPP and SLIP and I see no
difference in actual performance. Sting needs more CPX's and configuration
whatevers, so in the end it's just more hassle with the same end result.
(Well I can "ping" and "traceroute" with Sting, but I haven't the
slightest idea what I use I could make of that.)

To be a bit harsh, this seems to be yet another propeller-head program for
Atari. Lots of tech mumbo jumbo, and very little for an ordinary user.

Plug-and-Play is far away.

Message-ID: <340D58B4.3D65@gecm.com>
Source record: 117602

Hi,

I have a falcon with NVDI 3, I assumed to add new fonts you simply
had to store them in the font directories BTFONTS or GEMSYS, reboot and
use
programs supporting GDOS. But it does not work!
For example, EVEREST can only the standard NVDI font MONACO.

Can you help me?

Bruno

William get off dope, that heap is NOT doom for falcon, it's just some
crappy code that kind-of lets you walk around a VERY limited choice of
WAD files, it is NOT THE GAME. It is just as if it were a WAD viewer.
Don't EVEN call it DOOM! (I hope I'm wrong and that there is a playable
DOOM for Falcon somewhere.)

I am guessing that what you have is a 2 meg expansion board, with 1/2 meg on
the motherboard, for a total of 2621440 bytes in the machine. AFAIR, these
boards had solder pads for up to 8 chips.

I cannot find your original post, but I am assuming that you were expecting to
find 4 mbytes of memory in your machine.

My guess is that your memory configuration is correct for the hardware you
have.

Please post any corrections to my assumptions.

> especially they must be easy to configure. Any advice will be greatly
> appreciated.
> Sue.

You have at least three possibilities for web browsers
1)Chimera using MiNT... (PPP)
2)STiK/STing and CAB 1.5 shareware from many people!(SLIP)
3)CAB 2.5 from ASH (PPP)
4)WenSuite from OXO (PPP)
5)Termite(?) from Oregon Research (PPP?)
since you are fairly new (a novice driver?) I would stay
away from MiNT, and Termite is not yet available AFAIK.
That leaves commercial CAB 2.5 for PPP connection,
shareware CAB 1.5 for SLIP connections w/STiK or PPP
connections w/STing, or WenSuite (which btw is the only
one I've been able to connect with, without fiddling
away a weekend trying to figure out how to work it).

For creating a page check out Matthias Jaaps' naughty Penguins,
and there is WebSpinner as well by Simon Coward
plus...?

Thanks for replying, John. Yep, I picked up the same info from here, and I
used "no sort" on my Falcon to make sure that it was DRVIN.PRG, SCC.PRG,
and then STING.PRG, in that order. I also read the docs and removed the
unnecessary modules... Sure wish I had SLIP... :)

Thanks again! :)

>one or the other ;(Obviously, one is right and one is wrong...

I'll try both...

>Again, some use nothing or 0.0.0.0

I've been using the "blank" so I'll try 0.0.0.0...

>MSS = 2000 (I leave MSS,RCV_WND,DEF_RTT,DEF_TTL all blank! No
>RCV_WND = 11680 (spaces after the = sign on ALL blank statements.
>DEF_RTT = 50 (This speeds up STinG/slip about 3x !!! If these
>DEF_TTL = 128 (are optimized, your speed increase may not the same)

If I can get everything working, then I'll try this...

>NAMESERVER = 204.71.75.133
>NAMESERVER = 204.71.75.133 (Why the double entry?)

My ISP advised me to do this-that on a busy day, if I didn't have a fall
back NAMESERVER, that I would probably be kicked offline... Don't know,
but that is what they told me...

>PAP_ID = (If you do leave these blank, don't leave a space after
>PAP_PASSWD = (the = sign. It may not help, but does prevent Dr. Murphy
># (from invoking his famous LAW =), Curious though, where
> (did you get the idea of putting this PAP stuff in your
> (default.cfg file?)

??? It was already there... You mean its not supposed to be???

>=====DIAL.SCR=====
>WAIT = (These four lines are a bit odd. If it connects for
>REPT = (you, fine. But I find this unusable on my system.
>FIND = CONNECT
>RESP =

Well, if I don't have my script recognize that "CONNECT " (note the space)
then it hangs there, and won't go any further. I used to use the full

28800/V42/LAPM/BIS (or something like that) but then if it logged in at, say 26400, then it would hang also. Now, it just finds CONNECT and moves right along... :)

> 4) I'm only responding to this because Ronald was kind enough to

2702. Annoying ZIP drive message

Newsgroup: comp.sys.atari.st
Date: 1997-09-03 00:00:00 UTC
From: pointblank@geocities.com
Message-ID: <340dad3b.802918@news.demon.co.uk>
Source record: 117620

I know this has probably been discussed before, but does anyone think there is a chance of a printer port zip driver being written for the Atari?

I just use my Ste for fun, so convience with the PCs I have came first, so I bought a parallel drive.

Ok thanks
Chris

The Mega44 has a DIP switch which on the bottom which allows setting the ID..
The 3 switches should allow ID 0-7

>
> If this all works you should be able to use AHDI (or anything else for
> that matter) and , yes, you can boot from a ZIP.

What is the latest, greatest version, or other software which will give me
more flexibility to format ZIP disks.... my version of AHDI seems to have
only fixed bytes 20M being the smallest.

2704. ### Please help with dying Falcon

Newsgroup: comp.sys.atari.st
Date: 1997-09-03 00:00:00 UTC
From: Jared Addington <jdaddin9@airmail.net>
Message-ID: <0A260BCC91C24590.F2D5F15852CA1A14.116546D8E6899323@library-proxy.airnews.net>
Source record: 117622

I'm having a problem with my Falcon. The computer comes on and
completes the memory check. Then I hear the internal hard drive power
on and off and on and off, over and over again until finally it reverts
to booting by floppy. I figure it's one of two things; the power supply
or the hard drive itself. Any of you hardware guru's have an idea?
Thanks in advance.

-Jared

> curious if anyone AFTER login can find their dynamic IP listed anywhere
> in the CPX's, the Dialer conf's, or anywhere else...

Due to the grown structure how the Dialer does the login, it can't know the
IP address fetched via PPP (unlike the one fetched with $GET_IP), so it won't
show it. I'm reworking this part, so that the Dialer can give a little more
verbose and consistent status reports even with PPP.

You can always find the actually valid IP address for any port in the 'Port
Setup' CPX. So wait until the login has been performed, and wait a few seconds
longer until the modem LEDs are quiet, and you should find the IP address in
the CPX by examining the correct page (the one for the port with the modem).

Get rid of the saved 'Port Setup' CPX settings (delete STING.PRT, or what
you named it), and I guarantee the bombing bootup is fixed.

In article <Pine.BSI.3.96.970901140313.13004A-100000@usr03.primenet.com>,
Katherine L Ellis <kellis@primenet.com> writes:

> Hi, Well obviously, there are problems with STiNG.
> 1) the most obvious to me is: the installtion (eventhough, GEM-driven)
> is quite hard, because the user interface is not really well designed.

I guess it's simply because people don't understand how setting parameters
in STinG works. Perhaps I did not explain it thoroughly in the docs either.

Basically, some people want a textfile to edit (DEFAULT.CFG), others want a
GEM interface ('Internals', 'Protocols' CPX) to set up general default values.
Make sure you understand what 'general' and 'default' means ! 'General' means
values that are of importance for the networking on the whole machine, this
excludes for instance IP addresses or MTU values, as these are specific for
a particular port. 'Default' are values that can be set directly after bootup
to have the system in some defined state. The PPP setting is not one of them,
as an active PPP is going to initiate a negotiation of parameters immediately,
which cannot work until there is another active machine at the other end.
The CPXs are divided to threes because there are parameter for the core to
be set ('Internals'), for STXs providing high level protocols (TCP, UDP,
Resolver, done by 'Protocols'), and for STXs providing port drivers (by 'Port
Setup').

STinG is designed to cope with LANs too. You can have two machines connected
with, say, a Midi cable. When a machine boots, it should show up in a state
from where it can do networking straight away, without reconfiguring the Midi
port each time. Thus you can save parameters in 'Port Setup' CPX. The CPX would
automatically activate the Midi port on bootup. The modem port must not be
saved active here, as it requires further action (dialing) before it can be
used for networking. Here, the Dialer does all the work, so the 'Port Setup'
need not be touched for this.

So you see there is a distinction between permanent (local ?) connections, and
temporary (dial up) connections, the former being set up at boot time by the
CPX, the latter established each time by the Dialer.

> Example, useage of cpx, mixed with a dialer, with at least 2 or 3 ways
> to change the same parameter, MTU for instance, or serial port. (at
> the end, I don't know which one will be valid).

The CPX lets you edit the actually set values, the Dialer settings are values
that are to be set after dial in. If you configure the Dialer to set a different
value for, say, MTU for a particular port, then is set in the CPX, then after
dial in you'll find the Dialer's setting in the CPX too, because after dial in
the Dialer's value is used.

'change serial port', eh ? Here seems to be another huge misunderstanding. You, Katherine should understand this, as you're familiar with MiNTnet which provides the same functionality (contrary to STiK). In STinG all ports can be active at the same time. STinG can act as a router between them. Running it on a TT, STinG will work with up to six networking devices at once, so you can connect up to six other machines to the TT to form a network, STinG will handle this without problems. So what's the meaning of 'change serial port' ?

So unlike with STiK, 'setting the serial port' has no meaning in STinG. You could ask where to choose the port where a dial up connection is to be made, i.e. which the modem is hooked up to. The answer is obvious, in the Dialer of course.

> Also, the values are quit not explicit, example:
> Ip address in a port configuration? what IP address?

The IP address of the port of course. The IP address is not a parameter of the machine as a whole, but a parameter of the port. Generally, each port thus has it's own IP address. When using point to point connections you can give some ports the same IP address, but you must be very cautious when doing such things in a LAN.

IP addresses is one thing in networking on which many people suffer from severe misunderstandings, unfortunately.

> There are tons of address that you can fill up in sting, but none of
> them are really clear.
> DNS xxx.xxx.xxx.xxx would be comprehensible.
> Where is the DNS entry? Is that the on called NAMESERVER along with
> DOMAIN? If yes, pliz make it more clear, like a text line, or a
> title there saying DNS entry. Where it shoudl be numerical or alpha.

There is a problem with this, if you wanna operate the stack in a LAN too. As long as you don't have any modem connection, you'll want to use a different name server.

I guess the explanation of how the setup is done (above) clears this up. Default name servers (that are active even without modem connection) can be set in DEFAULT.CFG or the 'Protocols' CPX. The ISP's name servers cannot be reached without having dialed a modem connection, so they're set in the Dialer, which will make them system-wide available after dial in. You can check this, set the 'Protocols' CPX to a different name server, and look after login what it is set to.

> Well, that's very confusing, VERY confusing.
> And yet, I am running a full MINTNET+MiNTOS with PPP, and yes, that
> was WAY easy compared to any other stack to set up. Eventhough, you
> have to forget about the GEM interface for the setup.

I guess you have never used your MiNTnet to set up a LAN ? I even suspect you never constructed a MiNTnet setup from scratch ? I might be wrong, sure, but if you'd done it, you would not ask *these* questions.

> Why does the cpx of STING also have the MTU in teh serial part? (the
> one with submask etc).

Why not ? It's a port parameter ! Each port might have a different MTU ...

> Why does sting has DIALER 127.0.0.1? it's the loopback address, what
> should I do with that?

The Dialer docs explain this entry in DEFAULT.CFG. It is used by clients
to reach the Dialer for remote controlled dialing. A client on the same
machine reaches the Dialer through a loopback address, of course.

> Well in short, STING great, version 1.07 needs to be more explicit
> about things I would guess. Then more users would be able to connect
> painlessly.

I must admit the docs are in a desolate state, I guess it all boils down to
this. But then again a lot of info is in the docs, but people seem to get
scared by the state far to easily. It's highly frustrating to discover that
many people do not even read the FAQ ! That surely does not improve my moti-
vation to work on the docs at all. And up to now people were much more pressing
for a PPP, than for improved docs.

The setup might look a bit chaotic at first glimpse. But if you got a little
experience in networking, and know which parameter is needed for what device,
and how it influences others, and think about it, then everything drops in
place. Even if you were to design a new setup system, I believe you won't end
up very far from how it is done in STinG.

> Peter, keep up the excellent work. (looking forward STiNG 1.07 :))
>
> P:S I also get 2 bombs and/or drop the connection on a falcon.

Any bombs of course are definitely due to bugs. I haven't found this particular
one yet, which appears to strike only with Falcons (I don't have any), but even
then not with every machine. Someone reported he got rid of the problem by filling
in some values for the PAP-ID and PAP-Password. Try this, but please report if it
works, as any consistent info will help chasing this bug.

Cheers Peter

The Atari Computer Enthusiasts of Columbus would like
to extend an invitation to all Atarians to our Atari
swap meet Saturday, September 27, from 11:am to 5:pm.

The swap meet has changed location to the Oakland
Park Community Center located at 980 Lenore St. which
is easily accessible from the Cooke Rd exit off of I-71.

A map can be found at the following web page:

http://hcgl1.eng.ohio-state.edu/~steve/ATARI/swapmeet.html

There is an entrance donation of $2 and a 10% gross of what
sell no more than $3.

All Atari Models/Equipment/Software/people are welcome.

For even more information:

contact list: Wayne Arenz - rwarenz@infinet.com
Michael Steve - steve.2@osu.edu
Waynes World BBS - (614)761-1891
Charles Brown - (614)447-9789

Thank you for your time.

Source record: 117628

Well, I just tried out some of the suggestions I recently got...

Made CLIENT_IP = 0.0.0.0
Changed RESIDENT = FALSE (was true)
Deleted spaces at end of = that were blank
Tried the TCP_PORT = 1024 (was 2048)

None of these made any difference. Still can connect at 28800, logon, negotiate, grap IP address, and stay online. Can successfully ping internal to 127.0.0.1, and to the current IP address grabbed at logon, but nothing else returns. Sends like crazy-just no packets come back... :(

Thanks to one and all who tried to help...I'm beginning to think I can't get there from here...! :)

Hi Robert!

You should have told him that it costs US$7.50 + US$6.95 shipping. I've had a mail from Brad and he will /not/ be coming over for the British October Atari shows as it clashes with a US show. Also, even if he was, he wouldn't have brought any catalogues with him due to their weight - 40 of them would exceed the baggage allowance!

Regards
Peter

While the first one is an excellent idea to do, the second one should not
make much difference. True it saves a few kilobytes of memory, so you might
wanna do it anyway, it certainly doesn't do any harm either.

Chuck that old piece of crap into the bin. On my web page you'll find a
replacement CPX that offers all available baudrates up to 230000 bps when
used with HSMODEM.

> connects to my ISP at 9600. Any thoughts? Oh, yeah, I _am_ using HSMODEM

Yes. STiK uses a BAUDRATE variable in DIAL.SCR to set the baudrate. Set
this variable to 19200 at least. 38400 is a good idea, but works only with
HSMODEM.

Bad luck. The ST lacks several lines that are used extensively for such things
in the PC. So you won't get a parallel zip drive to work with an ST. It's not
a matter of a driver, but hardware.

From: Face the Slayer <chrishinds@delphi.com>
Message-ID: <hxdgo5y.chrishinds@delphi.com>
Source record: 117486

Hi all...

I've read the docs, read the posts, and tried lots of stuff, but Sting still won't work. Here's what I've done:

(My system is a Falcon with 14MB, running HSMODA07 and NVDI)

1. I removed all the modules except tcp, udp, serial, and resolve.

2. I copied the .cpxs and didn't touch any of them, except for serial.cpx, and making Sting "active".

3. I edited the dial.scr to include all the relevant stuff. BTW, I have a *static* IP address, which is different than most, it seems.

4. I edited the route.tab to include the line
0.0.0.0[tab]0.0.0.0[tab]Modem 2[tab]0.0.0.0

So, now the DIALER works fine and I can get "connected" without any problems or bombs, but when trying to Ping my ISP's nameserver, it sends out lots of packets, but none are received...the modem "send" light flickers, but the "receive" light is always dark.

While connected, I exited the dialer, and opened the CPXs...

Heres what I found:

1. In the PORT cpx, under Addressing-Modem 2, it has the Active box checked and it specified an IP address of 204.117.4.131 (which is my correct static address). Subnet mask is disabled.
Under General-Modem 2, the active box is checked and PPP is checked.

2. In the protocols cpx, under the Resolver option, it has the DNS server I specified in the Dial.scr, but under DOMAIN, it has stud.uni-hannover.de, which is obviously Peter's.

So, I then looked at the DEFAULT.CFG, and it had all kinds of Peter specific info in it...I hadn't touched this file up till now...was I supposed to?

I then changed Default.cfg to include my info, and rebooted: Result was exactly the same, except the protocol cpx now says 'agate.net' for a domain and no longer uni-hannover.

Help! Help! Help! What am I doing wrong? Up until the point of looking at the DEFAULT.CFG, I thought I was doing everything right, but now I'm completely confused!!

NVDI has two different types of fonts: outline fonts and raster "screen" fonts. Everest only supports the "screen" fonts. You must remember that Everest is a text editor, not a word processor or document processor or desktop publisher. Even if you change the screen font, your documents will still print out using the standard printer font! If you want to be able to see multiple fonts in a single document, and print them up that way, and use all those outline fonts youhave, you'll have to use something like Atari Works, or Papyrus.

Anyway, assuming you want to change the screen font in Everest (and there's good reason to do this, I, myself, swapped the system font for a font I got out of Edith that allows me to use a small size 9 or 8 font and fit more on screen), you sound like you are on the right track, but you forgot to update your ASSIGN.SYS file (this should be in the root of your C: or A: drive). Check out the NVDI documentation or snd me an e-mail if you need any help with this.

All the 127.x.y.z network is assigned to be the loopback network, so none
of these addresses are allowed on the net.

It's interesting to note that Macs and Windows etc, all only treat 127.0.0.1
as a loopback. Now due to this some ISPs had the silly idea to give their
modem server the address 127.0.0.100 or something, and give the modem clients
other addresses from this network. Worked well, until .... Linux came along,
which treats this properly, and did not work with those ISPs. So they had to
change all this. It's amazing how incompetent ISPs often act !

Needless to say STinG does it properly now too.

Murphy might have made your ISP to supply the modem server's and your IP address
in another sequence when PPP is selected. Have you checked this ?

Anyway your symptoms are precisely the ones of wrong IP address. Open the
'Port Setup' CPX, and check which IP address is shown there for the modem
port (after login), is it the same you noted in the Dialer before ?

> What about the DEFAULT.CFG-File in the STING-Directory? Have i to change

Should not be necessary.

m> screen with the Atari logo. Then I reinstalled the original 256K
m> SIMMs and everything was fine. So, could somebody tell me if parity
m> SIMMs are incompatible with Ataris?

It's never made any difference IME with STe's or MSTe's.

m> Or, I noticed a bank of 8 dipswitches next to the TOS chips. At this
m> moment, only switch 7 is switched on. All the others are off. Do I
m> need to flip one or more of these to make my MSTE recognize the 1 meg
m> SIMMs?

No modificatons are necessary.

It sounds like there maybe some problem with the memory. Perhaps you could
try installing just 2Mb in the first and third positions (from the front of
the machine) in all the permutations to see if you can identify any one (or
more SIMMs) that are damaged in some way? If you only ended up with 2Mb
you'd still be better of than before...

I think that if there is an IMG.PRT function try it. You will probably be asked for a *** x *** DPI specification, page size & so forth. make sure there is at least 100k free on your disk. 200k to be certain of success. a Calamus page as a big bit-image raster graphic is HUGE!

also try asking the people at MGI software. Onoe of them still remembers some of this.

>

The problem there is that I run 720x544xtc ALL the time because I can't get
a decent screen on my monitor without HRTC running.

So I can't switch to Nem Low :-(

My only option is to reboot :-(

Unless someone can write a patch to solve this problem :-)

Yours Roy

2731. Looking for games (TURRICAN, ARKANOID II, WIZBALL, SAVAGE, more

Newsgroup: comp.sys.atari.st
Date: 1997-09-04 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.090497.091505.55@wxs1-7.worldaccess.nl>
Source record: 117548

Hi,

I am looking for a couple of games because these games are said to have
so-called executable bootsectors, meaning that virus infection will cause these
games to cease working.
If you have any of the following games (original copies, no hacked/cracked
stuff!), please contact me at my personal email address; I will send you a
free copy of the latest version of the "Ultimate Virus Killer" so you can
make sure I can get the contents of these so-called executable bootsectors,
assuring that these can be restored again in case of virus infection.
If you have any questions at all, please contact me.

The games I am looking for are the following:

Savage (by Firebird, around 1988, 2 disks)
10th Frame (bowling game)
Football Manager II
Arkanoid II (Ocean)
Thundercats (Elite)
Hacker II (Activision)
Tetra Quest
Rampage (Activision)
Explora
Wizball (Ocean)
Tiger Road disk 1
Space Harrier (Elite)
APB Shop Demo
G.nius
Kennedy Approach
1st Person Pinball
Passing Shot
Turrican (not Turrican II)
Cabal (Ocean)
Pro Tennis Tour (Ubisoft)
Sonic Boom disk 2
Exterminator (ASL)
Ruff & Reddy + Yogi's Great Escape + Top Cat + Hong Kong Phooey (Hi Tec
Software, all these games on one disk)

I'd be eternally grateful. I am also looking for the "ST Guardian" and "LSD
Antivirus" bootsectors.

Cheers!

Hi Jared,
It's more than likely the internal IDE drive. Apparently, the original conner IDE drives fitted were faulty and eventually break. The best solution is to back up your HD and buy a new one. They're dead easy to install, though removing the many screws is a pain. I hope this helps.

Hi!

>It's usually ASH, the publisher of MagiC that's the problem. ASH is
>very arrogant, their standard reply (if they bother to reply in the
>first place, which they almost never do.) is "your Falcon is the
>problem. Fix it or live with it." My "fix" was to stop using MagiC ;-)

I read your four e-mails about this problem. My answer is not "fix it or live
with it". ;-)

However we found in the past that all accelerator boards cause the same kind
of problem. The timing of the whole system is screwed up in one or another
way because the developers forgot about something that is really important
and makes their product incompatible. This causes for example the problem
that diskettes can not be formatted when the board is active or in your case
that you cannot print.

You will agree that MagiC was out there first and if someone develops a
hardware product of any kind it is in his own interest to make it compatible,
so that it runs with MagiC. Geneva does not replace TOS, so it runs. MagiC
does replace TOS and MagiC is the OS for the Atari that is still being
updated, but we cannot track all the problems caused by new hardware. That's
not because we are arrogant. It's simply because we do not have the time to
do that.

Example: MagiC does not run on the Hades (TOS compatible computer from
Switzerland). Now someone is writing a fix to patch MagiC and we are very

thankful and do really appreciate it, because it is simply something we cannot do.

I could now go ahead and tell you - like the people from Nemesis told you obviously - not to use their product, because it is simply not completely compatible. It is not a problem at all that we send the Nemesis people a free copy of MagiC, so that they can try to find a way to fix it.

You probably know, that we ported MagiC to the Mac and the PC, which means that we where able to make it run on completely different computers, which basically means, that we do not have a very dirty software.

Greetings from Heidelberg,
Volker Ritzhaupt

Gerry O'Rourke

You should be on Master Mind!!

I can now confirm:

that my upgrade board is populated with 4 x 1meg 4bit Rams ie. 2meg!!

my shifter chip is under the upgrade socket!!

and I have solder pads for 4 more DRAMS!!

I phone NEC who confirmed that the D424400V-70 20 pin DRAM is now obsolete, but said that Mark 5 Limited UK Tel: 01705 618616, is a sort of offshoot and may have some DRAMS available.

Can I just solder in 4 more D424400V-70 DRAMS (or equivalent) and obtain the max 4meg RAM or is it more complicated than that??

Thanks Gerry O'Rourke

Hi Peter

If you're planning on writing a telnet, then why bother with VT100? Go for
VT220, that's what I'd really like to see on the Atari :-)

Gary

Can any one help. I am using STING and HSMODEM 07. When I switch on the hardware mod (RSVE) the modem is always drops but when it is switched off it works fine. It never caused problems when i went on BBS's. I have changed the 4040 and i have even removed the mod (worked as normal) but still have problems with the mod switched on ONLY ON THE NET.

BIG THANKS. DAF

There is one problem, tho! The ZIP drive has NO termination!
AFAIK, it MUST either have something else terminated (I use a tape drive)
that has termination power on it, or use something like Link that
supplies power, at least on my TT. I am not sure about the Falcon, tho.

I did kick out Modem CPX to, and now use the Serial CPX from the Sting
package, it works fine with my 28800 baud X-link modem.

Hello All,

Well, it's a little exaggerated BUT...

The 'delay' slider is not very explicit, is it ? Just to see what will
happens, I pushed it to the maximum (900) instead of the 50 by default and...
it's a charm :-)

Datas seems to come faster and se slider in Cab is very responsive now.

About the famous cache.dns ;-) I've noticed that if it only contains the
0.0.0.0 and/or 127.0.0.1 hosts, this will cause the message 'load cache dns
failed'. This could explain the surprise of some people.

If I disconnect (with the dialer) when Cab is running (but not waiting for
datas) I get a runtime error from Cab (and need to reboot) but the dial.log
is completed (with the cost...).

Bye All,
/Pascal/

Magic isn't just a GUI. It's a complete multitasking TOS compatible
replacement operating system. It's commercial though. You'll find links
to it in the Quick FAQ (see my below)

ZIP drives do have SCSI termination - a little switch on the back
toggles it, and another one to switch between SCSI ID 5 or 6.

I've had a ZIP drive for about a month now - no problems connecting it
at all. Occasionally it locks up, but I think that might be cos I
haven't has the SCSI mod done to my Falcon yet.

Neil.

2758. ZIP drives and MagiC problems

Newsgroup: comp.sys.atari.st
Date: 1997-09-04 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <40111523_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 117575
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hi guys

I posed this question a few months ago when I got my ZIP drive and never really got an answer.

I am running a Falcon with MagiC 5.11 (also used to be 5.03) and HD Driver 6.0, and MagXDesk.

I have a ZIP drive attached to the SCSI port.

If I boot my Falcon and there is no disk in the ZIP drive then I can't access it at all even when I put a disk in. I have to reboot. All I get is a gemdos error (can't remember which one, something like invalid drive).

If I have a disk in the drive with say 3 partitions, and then eject it and insert a disk with one partition, and try to access it, I get the same gemdos error as above. :(

Is this normal behaviour, or is it a bug in MagiC, MagxDesk, or HD Driver?

Seems very poor to me. If it is a bug, would it be possible to write a workaround (ie something that flushes the disk details and does a mediach)?

But surely the Falcon should recognise the disk has changed (or been inserted) and adapt to suit it?

Gary

2759. New Lower Prices! Atari!

Newsgroup: comp.sys.atari.st
Date: 1997-09-04 00:00:00 UTC
From: bensmith@kelly.teleport.com
Message-ID: <5unh3s$7ag$1@kelly.teleport.com>
Source record: 117576
Cross-posted to: or.forsale,pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. Everything mentioned on this list is on this list
because I have multiples of these Items and I thought I'd list them for
you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. And
Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore
CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives,
Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct
Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM
804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome
Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,
Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk
Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST
and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of
Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space
Eggs, Space Journey Math Educational Software, Target Practice, Temple
of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons &
Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the
Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The
Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World
Championship Karate. Productivity Software for the Classic Atari 8 Bit:
Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak,
Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc.

Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest

to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

You are close, an 8x1 simm is an 8 bit simm (no parity)
and a 9x1 simm is a 9 bit simm (8 bit + 1 bit for parity)

so, 8x1=non-parity and 9x1=parity.

But, the machine doesn't use a parity bit so it was just there and not
used.

>in another sequence when PPP is selected. Have you checked this ?

Now i have checked this, but the String after the word "to" is my IP
adress, which i get with $GET_IP. So there's no Murphy :-)

>Anyway your symptoms are precisely the ones of wrong IP address. Open the
>'Port Setup' CPX, and check which IP address is shown there for the modem
>port (after login), is it the same you noted in the Dialer before ?

Yes thats the same Adress. And PPP is also selected in the "Port Setup
CPX!" But no chance that i can recieve some packets.

>> What about the DEFAULT.CFG-File in the STING-Directory? Have i to change
>> some variables there to?
>
>Should not be necessary.

The PAP_USER and PAP_PASSWORD is in bothe files. Why this? and have i to
set the values in both files?

PAP is for authentication at dial up time, so very likely the login password
is the right one. As I noticed ISPs do all sort of weird things, some might
have even configured their modem server to ask for the e-mail password, though.
Ask your ISP if in doubt.

> PAP_ID = (If you do leave these blank, don't leave a space after

> (did you get the idea of putting this PAP stuff in your
> (default.cfg file?)

If using PPP within a LAN, this can be sensible. However the infamous bug that
makes it crash on Falcons at boot time would prevent this from working properly.

As the PAP parameter are really port specific, I'm thinking about redoing this
way the parameters are passed. For this reason it doesn't make much sense anyway
to have the parameters in DEFAULT.CFG.

Sounds just like Systems Solutions here. I sent them my disk to upgrade from
6.0 to 6.13, and they simply sent me back my original disk containing 6.0.
Waste of time that was. I just hope they manage the 7.0 upgrade :(

>rebooting the computer. That means if a removable media is not active
>when the computer is booted it cannot be accessed without rebooting.

I can appreciate it not knowing about the ZIP drive if it isn't turned on at
boot time. Obviously makes sense. But having to have a disk in it.... I
don't think so. This is crap.

>I had hoped that Uwe would fix that by adding an option to relog the

By your words, you have relegated your own argument to invalidity. IF all you ever used was a 520ST then you have no idea what modern Atari system software and hardware is capable of... Give a Falcon 030 or a Hades a try running NeoDesk/Geneva, MagiC, or Mint and you'll quickly begin to see just what I mean. Only someone with absolutely -no- idea of what they are talking about would ever call an Atari computers, a "toy"... :)

2771. Falcon SCSI problems

Newsgroup: comp.sys.atari.st
Date: 1997-09-05 00:00:00 UTC
From: Terry.May@rebel.ronly.org
Message-ID: <acd_9709052200@ronly.org>
Source record: 117388

I've been having problems with SCSI devices hooked up to my Falcon.

The most common problem is Imagecopy not being able to load a picture one time or showing the picture corrupted, but having no problem loading and displaying it a second or third time. This is especially a problem in true color.

Another common problem is occasionally not being able to read or write at all to the device, and getting a MagiC alert something along the lines of "Output device has not received any data," with the busy light on the device (and even in LED Panel) on steady. The only way out of this is to turn off the device and then turn it back on (no need to reboot), then press Cancel in the alert. It then generally continues on its merry way, even finishing writing the file with no errors, though often I'm left with some other corrupted folders and/or files and/or lost clusters.

A probably related problem I've been having is whenever I reboot, I get a rather harsh 'tick' sound coming out of the speakers, similar to the sound you get from a sound file that has some bad data at the beginning or end. And occasionally, out of nowhere, while my computer is sitting there, it starts making weird humming noises in different pitches. If I press any key (keyclick is on), it stops the sound.

I have also had one IDE drive go out on me, but I don't believe it's related, since that appeared to be a hardware problem specific to the drive, and its replacement (actually the original) is working fine. However, today I did get the "Output device has not received any data" alert for one of my IDE partitions (for the first time), with the LED Panel read light on. Obviously, there's no way to turn off my IDE drive, so the only way out of that was to reboot.

And speaking of rebooting, it's getting more and more difficult to reboot. I used to almost never have to shut off my computer to reboot. Now I have to do it quite often. Now I believe MagiC has something to do with that, but even when shutting off the computer, sometimes I have to leave it off for a couple minutes or more, and then sometimes it takes as long as a minute to come on after turning on the switch (and of course I get the loud 'tick' noise when it does begin booting).

Sorry for the long-winded message, but I didn't want to leave anything out.

Does anyone have any idea what's causing these problems and how hard/expensive it would be to fix them?

Actually, one of the switches (can't remember which) it to be
set if an internal, non-removable HD is also present in the case
beside the Syquest. That leaves only two DIP switches for ID
number.

Only one of their two previous e-mail addresses is still used. Be sure
you sent your e-mail to: oxo@imaginet.fr

I had been in contact with them about a month ago, but they have not
reponded to my more recent e-mail, so I don't know what is up with them.

2777. Re: ST Emulation

Newsgroup: comp.sys.atari.st
Date: 1997-09-05 00:00:00 UTC
From: bjr@Edison.EbiCom.Net
Message-ID: <5uo71g$c47@einstein.ebicom.net>
Source record: 117491

: Actually, what you are calling 'games for emulators' is pirate software.
: Trading them is illegal. Please go away.

Oh dear, you mean to tell me that a game that will run on my emulator is pirated? I could be wrong, but it looks to me like the poster is asking for games that are compatable with his system. I.E. if you have something that'll run under Pacifist (or whatever), I'm interested in trading or buying it from you.

Maybe you know something I don't, and if so, I apoligize, but your conclusion seems a bit hasty to me.

Brian

2778. Re: AixTT RAM board problems: help!

Newsgroup: comp.sys.atari.st
Date: 1997-09-05 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <NF4PC2F@tos.pl.net>
Source record: 117492
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I've got my AixTT board going!!

There were, of course, two separate problems - when it did work, only part of the RAM was recognised, and the other problem was that it ceased working entirely when I tried the 32MB SIMMs.

Well the problem where it ceased to work all together must have been a chance problem where the plug was not seated in properly or something. This problem just came right the next time I tried it.

The other problem was caused by the SIMMs I was using not having pins 67 and 68 correctly configured to represent the size of the SIMM. After I connected these two pins correctly, the full amount of memory became available.

Having more memory is a huge improvement after being limited to 8MB. I just can't believe how much easier it is to use the computer when I'm not having to worry about memory shortages all the time.

Also, the new memory is much faster than my old Atari TT RAM board, and the speed increase is definitely noticable in the regular use of the machine.

Now that the board is working, it seems to be going very well. I got a fright when the board stopped working entirely, but it seems that was just a chance problem, these things just happen sometimes. Now that it's working, I have to say I'm very pleased with the results.

Thanks to everyone who helped me with this!

I have never seen this board up close, but you should be able to solder the
RAM in & it should be found on startup.

It is possible the bank2 RAS & CAS lines are not connected; how many wires are
there between the ST & the memory board?

I will dig up the pin numbers for the MMU & you can check it out.

From: jbg@december
Message-ID: <341002d7.0@aacc-alpha>
Source record: 117495

I want to use the internal SCSI controller in my MEGA but it will not work for me. I connect it right, red side to pin one and all that, I hear the drive spin up but the machine doesn't access it. The disk is bootable and formatted for atari. Is there a special termination or SCSI id that I'm not using? I believe the disk is set for id 4, does it have to be on 1 or 0? Is ID 0 usable for is that considered the controller? AH! Please help, I wish to use this internal controller is I can use my ICD Link 2 with my ST.

Thanks in advance!

Amazing isn't it? That an entire platform's files fits into a ZIP disk....

Is this the A8 files only, or 16bit too? Is this every file uploaded to CIS _ever_, or do they remove old files after some time?

> I would really like to get a single file or three to simplify
> and speed backing up.

Perhaps I can help? I have a ZIPper on my Mac that I find to be much more reliable than the ones on the PC, notably on large files like this.

2785. New at Systems For Tomorrow (September 4th)

Newsgroup: comp.sys.atari.st
Date: 1997-09-05 00:00:00 UTC
From: sales@SystemsForTomorrow.com
Message-ID: <5up59k$gjc@uucp.tfs.net>
Source record: 117499

New at Systems For Tomorrow September, 4th 1997
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Radical Race for Falcon030 $49.99
Radical Race is an exciting new top view racing game (ala Power Drive Rally on the Jaguar) with an important difference: guns! Requires 4MB RAM and a Hard Drive. Jaguar PowerPads are supported. From Logitron.

Xplore CD for TOS Computers $24.99
This German disc contains mostly German PD and Shareware software (Go figure.) Also includes a collection of fonts and graphics for Calamus. Plus a few full version programs such as the ToXis virus killer. From Seidel Softwareservice.

MIDI Arpeggiator for TOS Computers $27.99
MIDI Arpeggiator is a mini-MIDI sequencer for creating arpeggios with your MIDI sound module or keyboard. The software can be used as either a compliment to a MIDI sequencer (as patterns can be saved as MIDI files), or as a live sequencing tool. It's Main features include: Two tracks of variable lengths (between two and sixteen steps) * Various play modes: backwards, forwards, ping-pong, random * Traditional arpeggiator-style chord buffer mode * Built-in MIDI mixer with user-programmable auxiliaries * Export sequences as type 1 MIDI files Record entire performances to disk as type 0 MIDI files * Real-time input using MIDI or built-in keyboard controller * Auto-generating harmony part MIDI synchronisation, program change, and tempo settings * On-line hypertext manual using ST-Guide

In a recent issue of Atari Computing (issue #4), MIDI Arpeggiator was awarded 85%; the pros mentioned the "amazing price, on going development" and that it's "great fun"! Requires 1MB RAM, 640x400 Minimum resolution. From Electronic Cow Software.

Sound Chip Synth for TOS Computers $19.99
Sound Chip Synth is a software-based sound synthesiser that uses the built-in FM sound chip inside the ST to generate analogue-style bleeps and squidges. These noises are created from a range of synthesis functions including: oscillator select, tuning (fine and coarse), envelope generator, and amplitude modulation. Once synthesised, these sounds can be played within the software (using Sound Chip's MIDI capabilities), or exported as AVR samples for use in other programs. It's Main features include: Sample export, with variable pulse width settings and co-processor support * New multiple window system - all dialogue
~~~~~~~~~~~~~~~~~~~~~~~~~~~

boxes are now in windows * Choose between three different waveform types (square, triangle, and sawtooth) * a choice of 8- or 16-bit sample export (AVR or RAW formats) * user-definable MIDI performance controllers * Five eight-stage envelope generators * On-screen controller keyboard, or playback via MIDI control * Three tone and three noise oscillators * On-line hypertext manual using ST-Guide

A recent review in Atari Computing issue 2 (December 1996) gave the software 85%, stating that: "SCS is an attractively-designed, easy-to-use program... the program excels at what it does, and the results speak for themselves." Requires 1MB RAM, 640x400 Minimum resolution. From Electronic Cow Software.

Snippit Synth for TOS Computers $29.99
Creates hugely varied samples from tiny pieces of waveforms, using a granular synthesis technique (modelled on Denis Gabor's physics paper "Acoustical Quanta and the Theory of Hearing", published in 1947), and then save all your efforts as samples. It's Features Include: Control all three of the main sound elements of each composite grain: frequency, time, and amplitude * Broad range of dispersion patterns, algorithm types and additional functions * AVR, SPL, and AIFF sample export * MIDI sample dump (MMA) * Sound Replay on DMA Machines (STe/TT/Falcon). Requires 1MB RAM, 640x400 Minimum resolution. From Electronic Cow Software.

Alien Thing: Expert Edition for ST/STe/Falcon $19.99
Alien Thing is an exciting top view shoot-em-up that pits you against an invading horde of aliens. You must stop their spread, kill their queen, save the earth, and possibly even live to tell about it. Includes the origional 11 levels, plus 11 additional Expert levels. For ST/STe/Falcon. From 999 Software.

Cardinal 28.8/33.6 External Modems $79.99
These refurbished modems from Cardinal started life as 28.8, but thanks to their upgradable Flash ROMs, they are now 33.6. Finaly, an inexpensive modem from a company you have heard of! Serial Cable not included. 90 day Warranty from Cardinal.

Scan X for TOS Computers $49.99
Microtek E3/E6 scanner driver is an easy to use GEM application that provides full access to most Microtek single pass scanners, mainly the 24bit Microtek E3 & and the 30bit E6 flatbed scanners. Features of ScanX for Microtek scanners: 24Bit (or 30bit) (16.7 M colors), 8Bit (GrayScale), 1Bit (Monochrome) HalfTone and LineArt, Variable resolution settings: 50 - Max. supported by scanner, Contrast setting, Brightness setting, Exposure setting, upto 8.5"x14" scanning area, PreScan Window with Clipbox, Scanning velocity setting, 12 built-in HalfTone pattern setting, Fast direct to disk scanning (little memory usage) for 1 & 8 Bit scanning, Save images as IMG and TGA, Positive or Negative

scanning, BackTracking, 3D modern look, MultiTasking friendly
scanning, and more. From Homa Systems House.

Also Available:
Tetris II $11.99 Cool Tetris game
Power Up $19.99 Racing fun for ST/STe/TT/Falcon
Desktop Solitaire $19.99 8 solitaire card games for TT/Falcon
Face Value $69.99 Visual style GFA programming
All Things Falcon CD $9.99 Tons of Falcon PD/Shareware on CD
Hard Disk Sentry $39.99 Optimize that Hard Drive
Photo Show Falcon $9.99 View Photo CD discs on the Falcon
Card File 4 $29.99 Personal Information Manager
Moving Pixels CD $29.99 Software Collection /w sources on CD
ESG Clipart CD $19.99 IMG, CVG and GEM/s clipart on CD
MIDI Maze $4.99 The classic happy face shooter!
True Paint $19.99 GEM based paint package
Plus about 400 additional products for your TOS Computer!

Hi All,

Back in the old days, before the suits left, I seem to remember Domark releasing a 95 season data disk for Championship Manager.

I've got CM '93 (obviously) and the '94 data disk. Can anyone help me find a copy (original, natch) of this elusive '95 data disk, please ?

Obviously, I'd be willing to pay :o))

I know I'm sad, but just think how much worse I'm gonna be when they release Championship Manager for the PSX ! I just know I won't see the light of day ever again ... ;o)

Thanks,

See ya,

Mark.

Source record: 117504
Body handling: HTML body converted to readable text

Thanks to those who responded to my previous posts,
my MEGAFILE is now sold! ;-)

The following items remain FOR SALE/TRADE:

* 4160 STE (TOS 1.62, 4 Mb) ==>> ie: 1040 STE @ 4 Mb
* MEGA-ST 4 (TOS 1.04, 4 Mb)
* SLM 804 Lazer Printer
* STM 1 Mouse
* Softwares
DTP: Timeworks - Publisher
Soft Logic - Publishing Partner
Music: Dr.T - D-50/D-550 Editor
Dr.T - D-10/D-110 Editor
C-Lab - Notator SL 3.1

Offers from Canada and United-States only!

Preferably TRADE against following products WANTED:

* MEGA-STE (TOS 2.06, 4Mb Ram, Internal HD)
* STacy 4 (TOS 1.04, 4Mb Ram, Internal HD).
* Crazydots-2 graphic card for TT (or equivalent ET-4000 card)

NOTE: Canadian banks cause troubles for cashing foreign currency
of any kind, including American. This can be avoided by an
electronic fund transfer (Western Union or similar), which
is usually cleared within 48 hours of transaction.

Nonetheless, if you're interrested in trading your MEGA-STE
or your STacy, we can arrange something, as no money would
be trading hands accross the border.

Complete list of items I'm selling or looking for on my homepage.

: disk? Can I use a Null-modem cabel?

To move a file from PC to ST via floppy disk you'll need a 720k disk,
format it on the PC to 720k, and then copy the files onto it that you
want to transfer. Then take them over to the ST and use them there.
Your ST will be able to read the PC 720k floppies.

That's just not true. STiNG is working fine here. The documentation could be improved, but I believe that some of the problems people encounter installing it are because it has so many more options and is so much more flexible than STiK. Maybe a minimal configuration of STiNG for dial-up connections only would help.

I've been eagerly anticipating the PPP version of STiK for almost a year. Why should I wait any longer when STiNG wworks with PPP now! Peter has done a great job with STiNG and it can only get better. Let's support all Atari programmers!

2797. Re: ZIP drives and MagiC problems

Newsgroup: comp.sys.atari.st

I don't know about the newest version of HD driver because Toad Computers retained my original 4.? version and never sent me the upgrade, but the version I have will not relog the drives without rebooting the computer. That means if a removable media is not active when the computer is booted it cannot be accessed without rebooting.

I had hoped that Uwe would fix that by adding an option to relog the hard disks to a CPX as ICD software does. Sounds like he hasn't done that yet. My version of HD driver does correctly deal with media changes if my Syquest drive was ready at bootup.

Message-ID: <5uq54f$9pn$1@news.ibi.co.za>
Source record: 117512

As did many others I tried very hard to get the new Sting up and running.
After a lot of wasted effort,inummerable reconfigurations of the set up
and some absolutely non productive telephone connections (without any
two way packet streanms or whats the other word.....ah yes its
resolving!!), I have given up. For now at least.
I'll keep watching developments however as there has to be a resolution
to my problem,one that I had hoped Sting would bring.
The problem I have is that on the first login of a session I can
almost always get a carrier first time but the call gets dropped within a
couple of minutes. Just as I try to collect my mail, sometimes during the
downloading of the first or second message, the line is dropped. I know
when it it going to happen as line activity stops and about 40secs. later
click goes the modem. I then try to login again after properly
disconnecting StiK and re-enabling it. Most often it takes 4 to 8 tries
before I can get a carrier. Each time my ISP's modem picks up my call I
pay the phone company even when I don't get a carrier. When I do get going
for the second time I can be on line for as long as I need to be with no
problems at all. Sometimes if I'm using CAB or perhaps downloading a big
file by FTP I'll be on line for an hour or more without any fear of a
dropped call.
There just has to be a resolution of this problem. Anyone got any ideas ??
TIA
Ted

RW> I believe ICD format.PRG works only with an ICD host adaptor.

Unless you have ICD Pro, which doesn't require a host adapter, allowing it to
work in Falcons, which don't need a host adapter.

Also, Diamond Edge has very a nice partitioning utility, but it doesn't format.

Source record: 117515

I'm expecting to be in the UK in Dcember and have some spare cash to
invest in my Atari Falcon set up. Im seeking advice on what to spend the
money. I'll have about 150 UK pounds.
My system is a 4meg Falcon with a 120Mb IDE internal Hard Drive. It was
supplied with the Power Up accelerator(don't hear anything about that
these days !!)
Peripherals are
1. 14" SVGA monitor
2. Zip Drive
3. 28800 US Robotics Sportster Modem
4. Canon BJ200 printer
I have NVDI v4.0, Kobold v2.5,HDDriver v4.5,Ease v5.0
My use for the Falcon are;
1. to run emagic logic v2.5 (I have a suiable amp,tape deck and speakers)
2. Internet access. I use Stik,CAB v1.5, Newsie v0.79,Popwatch v2.10.
3. Word processing. I've just received Protext v6.6
4. Spreadsheets. I use Atari Works.

My current thoughts are;
1. Upgrade HDDriver to latest version
2. Buy CAB v2.5...if the english version is available by then
3. Maybe Nemesis....if its is possible....perhaps need to remove Power
Up. I wonder if I would see a difference
4. Maybe Videlity... I tried the shareware screen expander but it would
not work with my Phillips SVGA monitor.
5. Perhaps a memory upgrade but I fear this will cost more than I have.

Lets have your suggestions either via the news group or email. I'll
acknowledge all email messages.
TIA
Ted
Ps Are there any Atari shows in London in mid Dec. ?????

>could give a couple of hints&tips, even if you didn't have MiNT installed...

Hello Miika,

You have to tell me about the problems, if I can help, I will.
I run Hades 060 MiNT/N.AES and before that I ran Hades 040 MiNT/N.AES
without any problems whatsoever. If it's a060, your friend has to get the
special 060 compiled version of MiNT. This should be on the system disks,
if not, you can DL a copy from the Medusa homepage.

Sorry, but I feel I *have* to throw my two cents in.
I don't even have an ST, but a friend of mine uses one as a sequencer
and I recently started fiddling with it, and finding out what the STf
can and cannot do. I was quite surprised to find that there existed
a TCP/IP program for the ST...and 2 of them at that! I downloaded
STik, and didn't like it, and went to STinG.

Now, keep in mind I have had, all totalled, about 1.5 hours of ST
experience. I found STiNG to be incredibly easy to install, once
I found out what a .CPX file was (thanks, Peter) and that I needed
Xcontrol (Thanks again, Peter). Once I knew these two, I had STinG
configured and hand-tuned on my home pc, and put it on the ST and had it
up and running w/ CAB 2.0, Antmail, mg-ftp, and telnet (all from
720k floppies, no less) in about 10 minutes...minus the mind-bogglingly
slow copying of files from disk to disk.

If I can do it with an hours worth of ST experience, then what is
the problem everyone is having? There's a lot of documentation with
STinG, is anyone reading it?
Maybe it's not a problem with STinG or its docs...maybe it's a lack
of knowledge of TCP/IP stuff...maybe it was so easy for me since I've
been editing makefiles and such on unix boxes since I stood chin-high
to a 3B-50.

There, I said what I had to. Peter's program is wonderful, however,
I do miss the old version of ping B*)

Well, if you can earn your living with a toy (as was very often the case with me and my ST) it is no longer a toy.

Apart from that, most PC users I know use their computers as sophisticated toys. They don't really realize even 10% of the power their own PC has. I know what I say. I lived for a year in an Oxford college and was treated like a "computer wizard" - people really knew hardly anything about their PCs. More or less the same about "computer consultancy" people at the University Computer Centre. Yes, they were experts on UNIX and their machines crashed more or less twice a week. So you have your answer: the more sophisticated the toy is, the more impossible it is to control it. That's why some people prefer the Volkswagen Beetle and Atari ST.

BTW, now I have both an ST and a PC and each of them has its own uses.

I agree to a certain degree, but I have no choice at the moment but to continue using my trusted old Atari. I just don't have the money to buy a modern computer. So I'm very grateful to all those programmers who have not given up, but continue to develop software for the ST. Otherwise I would be cut off from the wonderful Net world.

Of course a decently upgraded ST with the latest software is much more than a toy, even though it can't be compared to a modern PC. I have developed megabytes of web pages and, some useful cgi-scripts in perl, using my Atari. That, I think, goes some ways beyond toying.

Could you give a short definition of 'toy' and 'computer' ? :-))
Sure, the Atari is not as fast as a HP-9000 with four HP-PA-RISC CPUs,
896 Mb of RAM , 350 Gb RAID-5 Hd ... etc. [I work everyday on this
type of computers, in a bank at Luxemburg].
But, even if the Atari is a slow and outdated machine, it is really a
computer... do you know many toys which can run an Unix operating
system like Linux ? I know other 'toys' which can : Amiga, DecAlpha
(from DEC, VOBIS, &c), PC >= 80386, Sun Workstations etc .

Cheers !

Jean-Paul

PS. I have some toys at home : 2 Amiga, 1 PC, and a DecStation. but no
Atari !

Hi Roy and greetings to Volker,

As the developers of the Nemesis accelerator we obviously have our own
ideas about the problem, although my collegue, Douglas Little, is more
technically versed than I am with regard to a possible solution.

>>It's usually ASH, the publisher of MagiC that's the problem. ASH is
>>very arrogant, their standard reply (if they bother to reply in the
>>first place, which they almost never do.) is "your Falcon is the
>>problem. Fix it or live with it." My "fix" was to stop using MagiC ;-)

Firstly, I hope Roy made it clear that we DID NOT write this!

>However we found in the past that all accelerator boards cause the same
kind
>of problem. The timing of the whole system is screwed up in one or anoth=
er
>way because the developers forgot about something that is really importa=
nt

But what did we forget? The timing is fine for all areas of the
motherboard, and printing is possible with the bus at 25MHz under TOS.

>and makes their product incompatible. This causes for example the proble=
m
>that diskettes can not be formatted when the board is active or in your
case
>that you cannot print.
```

Not true with Nemesis. The problem that previous accelerators had with di=
sk
problems was due to the DMA. Nemesis fixes this and floppy/SCSI data
transfers work 100% reliably at 25MHz.

>You will agree that MagiC was out there first and if someone develops a

Yes I agree.

>hardware product of any kind it is in his own interest to make it
compatible,
>so that it runs with MagiC. Geneva does not replace TOS, so it runs. Mag=
iC

Not really. It is not a case of who's first to develop any product. That
would mean everyone has to conform to a standard that was laid down some
time ago, and which is probably no longer relevant.

Replacing TOS also breaks the standard mode of operation, and all other
OS'es seem to work correctly with a 25MHz Bus.

>does replace TOS and MagiC is the OS for the Atari that is still being
>updated, but we cannot track all the problems caused by new hardware.
That's

I agree that it must be difficult to follow all the changes, but all
accelerators in the past have had problems controlling the DMA properly.
Nemesis fixes this. MagiC only presents one problem - printing - and this=

is something we are unable to fix without specific knowledge of how you
implement the printer routines.

>Example: MagiC does not run on the Hades (TOS compatible computer from
>Switzerland). Now someone is writing a fix to patch MagiC and we are ver=
y

Not really the same problem from what I understand. MagiC works with
Nemesis except for printing. MagiC doesn't work with Hades at all (?)

>I could now go ahead and tell you - like the people from Nemesis told yo=
u
>obviously - not to use their product, because it is simply not completel=
y

Not so! At times we use MagiC!!! (not for printing though :-)) However yo=
u
are saying that no-one should accelerate their Falcon because it won't wo=
rk
with MagiC. Indeed, Roy sent me a mail this morning from a BlowUp FX user=

who experiences the same problem, and his machine is only running with an=

18MHz Bus. Nemesis does at least allow printing at 20MHz.

The problem Roy, and others, are experiencing is that because
high-resolution (736x560 and above) true-colour is possible on VGA (for t=

he
first time!) with a 25MHz Bus, using the Nemesis 20MHz software switch (t=
o
enable MagiC printing) causes the screen to lose sync.

>compatible. It is not a problem at all that we send the Nemesis people a=

free
>copy of MagiC, so that they can try to find a way to fix it.

As the problem will be much, much, easier to fix yourselves, we are quite=

happy to send you a Nemesis accelerator. As you probably know we have tri=
ed
to fix the problem already, but didn't succeed. This is not possible unle=
ss
you give us specific information about your printer routines.

>You probably know, that we ported MagiC to the Mac and the PC, which mea=
ns
>that we where able to make it run on completely different computers, whi=
ch
>basically means, that we do not have a very dirty software.

I don't think this is really relelvant. We know, for instance, that the
Falcon's electronics are "dirty", which was one reason why it was much
harder to implement Nemesis in the first place.

We really would like to see this problem solved, but can't see this
happeneing unless we are given all the relevant information. We are very
busy ourselves ATM, but are still prepared to spend time trying to solve
the problem. Unfortunately it's like "looking for a needle in a haystack"=

unless you can forward the specific information regarding your printer
routines.

We are quite happy for you to include this code into future releases of
MagiC.

Well, likewise, up till recently. However I'm contemplating getting a
dreaded PC in order to run MagiC PC and get the best of both worlds.
And yes, some of the net software for Ataris is a little crude
compared to PC equivalents, but then some of it is really neat.
Popwatch for example. Beautifully simple, versatile, and small! And
the combination of CAB, Everest (with kurzels) and OLGA is excellent
as an HTML authoring suite.

>>>Plug-and-Play is far away.

>
>I cringe at the thought of the set up hassles that just have to be
>involved in this!

Well, the networking might require a little work, but it can't be any
worse than getting PCs to talk to each other over Novell, having
watched one of our technicians at work doing it.

The baby web server mentioned above has to be the simplest thing on
the planet to set up. You just run it! The only thing to configure is
the font it uses in the log window... Not that it's much use to me as
I have a dial-up account (and that has some free web space with it),
but I was intrigued so grabbed it and tried it. If the Super Server is
half as easy you'll be able to configure it in your sleep...

This is a known problem? Seems like Conner would've placed a recall on
the units? The hard drive is too sporatic to even boot so that I may
copy anything off of it.
Thanks for the info!

: I believe ICD format.PRG works only with an ICD host adaptor.

This is not correct if you are using ICD Pro it will format without a host
adaptor.

I have an Atari Falcon 030 for sale. It has 4 megs of ram and a 60 meg hard drive. With original manuals, cables, and some software. I'd like to get around $350, or best offer.
Must sell soon.....Thomas

bloody@primenet.com

Get hold of POPwatch 2.21 from my web page. It's FREE :-)

>My current thoughts are;
>1. Upgrade HDDriver to latest version

This is defiantely worth doing. Don't think it costs very much either.

>2. Buy CAB v2.5...if the english version is available by then

It is. :)

>3. Maybe Nemesis....if its is possible....perhaps need to remove Power
>Up. I wonder if I would see a difference

Nemesis is far better than PowerUp2. I used to have PowerUp2 fitted. The
Nemesis guys removed it and fitted Nemesis. PowerUp2 made a very small
improvement to the Falcon's speed. Nemesis makes a *massive* difference and
allows you better screen res and more colour. ie. 640x480x65k colour on a
SVGA monitor. It's definately worth the small price!!

>4. Maybe Videlity... I tried the shareware screen expander but it would
>not work with my Phillips SVGA monitor.

I've bought this but never use it. Yet....

>5. Perhaps a memory upgrade but I fear this will cost more than I have.

I believe a 14Meg upgrade is about 130UKP (roughly).

Hope this helps a bit,
Gary

Like I said, I use HD Driver 6.0, so I guess you'd know if it doesn't honor
the messages? :)

>> Is this normal behaviour, or is it a bug in MagiC, MagxDesk, or HD Driver?
>

>A workaround makes no sense. Media changes have to be reported and
>recognized. Anything else is not satisfying.

Of course it makes sense. If HD Driver/MagiC doesn't do it for me, then
until HD Driver/MagiC is fixed, a worked around is needed.
All I was getting at is:
a) Do other people get this problem or is it just me?
b) If I wrote a program to flush the disk info and force a media change,
would it work?

Gary

Why in the world would I want to call a program "crap" and erase it from my HD's (if I even *had* a HD <grin>) when I use it every single day? Dan Ackerman and Steve Adams do deserve our support, but Peter has done a marvelous job and should be recognized (he says, guiltily, knowing very well that he hasn't even sent a postcard... a situation which will soon be rectified).

I've got a lot of respect for the people in this newsgroup, both those that aren't afraid to ask questions, and those that are willing to take the time to answer them.... sometimes for the two-hundreth time. But more and more a phrase from my youth keeps popping into my head:

"RTFM!" = "Read the 'Friggin'' Manual!" - Um... that comes out harsher than I meant - all I really mean is that the information is in the documentation. Follow what it says. Start with a simple set-up if necessary, and then if you want to add or change things, do them one-at-a-time, so that you can keep track of what you did if STinG suddenly stops working, and then try to figure out what the conflict is.... don't just blame it on a fine program - too many of us are using it every day for it to be *only* the fault of the program.

Anyway, I'll shut up now :)

It does not however supply Termination power which is the problem as
many host adaptors such as the Link reuire Termination power in order to
operate.

: Why don't you give up Atari owners?
: I had an Atari 520 ST between 1989 and 1996.
: OK, I liked it and I was happy with it, but let's face it:
: the Atari is a toy and not a computer.

Let's ask a more important question:

Why is is that those who are not Atari users insist on spending their valuable time berating those of us that are?

I personally have better things to do that harass those that use things that I don't happen to care for.

As far as an Atari being a toy, what is that supposed to mean? I have use my Atari computers for desktop publishing, accounts, telecommunication, fax, word processing, data base management, computer graphic design, animation, digital recording, MIDI recording and composition, as well as just for recreation. Just because a computer was designed to allow leisure activities (early Atari computer PCBs even say "Creative Leisure" on them) doesn't mean that it is incapable of work.

I have always enjoyed the fact that Atari computers were capable of creative activities in addition to bean counting. In fact, I believe that to be a superior capability! Any computer can shuffle text or add numbers; for many years, Atari's were the only ones that could manage music, animation, and sound too. I still have yet to find anyone that has been successful in putting together a MIDI studio with a PC without being plagued by hardware problems and sloppy playback.

If you consider any computer that is used for interesting, creative applications to be a toy, then I pity you. You will never understand what computers really have to offer. It's funny, as the rest of the computing world continue's without Atari, the more that computers and operating systems are becoming just like them.

So you ask why we just don't give up? It would be wasteful and foolish to stop using something that remains useful. My computers can manage control of 15 MIDI instruments and multi-track digital audio recording better and for a lot less money than is possible elsewhere. They also meet almost all of my computing needs. Why give up on something that works?

Aloha,
John Perez - jperez@hawaii.edu

Hi Roy and greetings to Volker,

As the developers of the Nemesis accelerator we obviously have our own
ideas about the problem, although my collegue, Douglas Little, is more
technically versed than I am with regard to a possible solution.

>>It's usually ASH, the publisher of MagiC that's the problem. ASH is
>>very arrogant, their standard reply (if they bother to reply in the
>>first place, which they almost never do.) is "your Falcon is the
>>problem. Fix it or live with it." My "fix" was to stop using MagiC ;-)

Firstly, I hope Roy made it clear that we DID NOT write this!

>However we found in the past that all accelerator boards cause the same
kind
>of problem. The timing of the whole system is screwed up in one or anoth=
er
>way because the developers forgot about something that is really importa=
nt

But what did we forget? The timing is fine for all areas of the
motherboard, and printing is possible with the bus at 25MHz under TOS.

>and makes their product incompatible. This causes for example the proble=
m
>that diskettes can not be formatted when the board is active or in your
case
>that you cannot print.
```

Not true with Nemesis. The problem that previous accelerators had with di=
sk
problems was due to the DMA. Nemesis fixes this and floppy/SCSI data
transfers work 100% reliably at 25MHz.

>You will agree that MagiC was out there first and if someone develops a

Yes I agree.

>hardware product of any kind it is in his own interest to make it
compatible,
>so that it runs with MagiC. Geneva does not replace TOS, so it runs. Mag=
iC

Not really. It is not a case of who's first to develop any product. That
would mean everyone has to conform to a standard that was laid down some
time ago, and which is probably no longer relevant.

Replacing TOS also breaks the standard mode of operation, and all other
OS'es seem to work correctly with a 25MHz Bus.

>does replace TOS and MagiC is the OS for the Atari that is still being
>updated, but we cannot track all the problems caused by new hardware.
That's

I agree that it must be difficult to follow all the changes, but all
accelerators in the past have had problems controlling the DMA properly.
Nemesis fixes this. MagiC only presents one problem - printing - and this=

is something we are unable to fix without specific knowledge of how you
implement the printer routines.

>Example: MagiC does not run on the Hades (TOS compatible computer from
>Switzerland). Now someone is writing a fix to patch MagiC and we are ver=
y

Not really the same problem from what I understand. MagiC works with
Nemesis except for printing. MagiC doesn't work with Hades at all (?)

>I could now go ahead and tell you - like the people from Nemesis told yo=
u
>obviously - not to use their product, because it is simply not completel=
y

Not so! At times we use MagiC!!! (not for printing though :-)) However yo=
u
are saying that no-one should accelerate their Falcon because it won't wo=
rk
with MagiC. Indeed, Roy sent me a mail this morning from a BlowUp FX user=

who experiences the same problem, and his machine is only running with an=

18MHz Bus. Nemesis does at least allow printing at 20MHz.

The problem Roy, and others, are experiencing is that because
high-resolution (736x560 and above) true-colour is possible on VGA (for t=

he
first time!) with a 25MHz Bus, using the Nemesis 20MHz software switch (t=
o
enable MagiC printing) causes the screen to lose sync.

>compatible. It is not a problem at all that we send the Nemesis people a=

free
>copy of MagiC, so that they can try to find a way to fix it.

As the problem will be much, much, easier to fix yourselves, we are quite=

happy to send you a Nemesis accelerator. As you probably know we have tri=
ed
to fix the problem already, but didn't succeed. This is not possible unle=
ss
you give us specific information about your printer routines.

>You probably know, that we ported MagiC to the Mac and the PC, which mea=
ns
>that we where able to make it run on completely different computers, whi=
ch
>basically means, that we do not have a very dirty software.

I don't think this is really relelvant. We know, for instance, that the
Falcon's electronics are "dirty", which was one reason why it was much
harder to implement Nemesis in the first place.

We really would like to see this problem solved, but can't see this
happeneing unless we are given all the relevant information. We are very
busy ourselves ATM, but are still prepared to spend time trying to solve
the problem. Unfortunately it's like "looking for a needle in a haystack"=

unless you can forward the specific information regarding your printer
routines.

We are quite happy for you to include this code into future releases of
MagiC.

>>_only_ reason I still use Atari is the size of my wallet. I just can't
>>afford a new computer at this point in time.

Well, I could easily afford a new computer at this time. However my
Falcon(s) more than serve my purpose. I couldn't see myself staring
Win95 in the face everyday. I would puke.
STiK works fine here. Newsie blows away Netscapes features, and with a
lot less memory and ease of use. CAB work fine as well.
Most peoples bitches here concern a PPP connection. I live in a small
town (20k), with three, count them, three providers. Two of the three gladly
set up a slip account for me. One is a Unix host, and the other an NT
server. I don't know what the problem is, other than lazy or cheap help
at the host site that can't or won't enable Slip. It is an easy thing.
STiNG is either having teathing problems, or maybe lacks a little in
the docs, but it must work as a few do have it setup right.
The MiNT experts here have pleaded with people to tryout either the
PPP kit or a full installation. Those with 1/2 meg 520's are simply
out of luck, just as much as the C64 and 800's users are when it comes
to visually navigating the Net. Those users either do have a dual set
up, or upgrade to a more capable TOS platform.

But the bottom line is that the problems users are having with STiNG
does not reflect the general performance of other packages, or the hardware
itself.
And none of it written by a Bill Gates investment.

I got the new Sting working fine with the demo of CAB 2 and Newsie. Odd, as I couldn't get the old Sting or Stik working with CAB at all, however I changed scripts, etc., but had no trouble with the new Sting.

I like to have keyboard equivalents in dialog boxes, and have Let em Fly in my auto folder to get this in many programs that don't themselves have this feature.

But Sting's dialer doesn't seem to support this. It would be good to have Sting modified so that it either has its own keyboard equivalents for the buttons or works with Let em Fly.

Has anyone actually gotten any decent service from Toad lately? I've been waiting for a month for Kobold, after being told they had it in stock and it would ship that week. After ignoring several of my emails, they finally answered me telling me it shipped what is now almost two weeks ago (and more than two weeks after I ordered it).

This is not an isolated incident. The last time I ordered something from them, it was again a simple software item. They said they had it in stock, and I told them I was in a hurry so I ordered it 2nd Day. I got it about two weeks later.

Someone else I know has been waiting for MagiC for well over a month, and he can't get a response out of them.

I know they've cut back on their Atari support, but this is ridiculous. If they don't want to sell Atari stuff, they shouldn't pretend that they do, and then jerk people around.

As I told Jennifer, "Fool me once, shame on you; fool me twice....."

GP> Come on ZIP drive owners, speak up :)

So far I haven't had that problem with HD Driver 3.06 and MagiC 5.11.

GP> b) If I wrote a program to flush the disk info and force a media change,
GP> would it work?

No need to reinvent the wheel. Look for TCache 6.4. It can be configured for force media changes on any drive whenever it is accessed. Especially useful for floppy drives that don't notice media changes, but it can be configured for any drive.

* LED v1.51 * For Atari support call The Rebel BBS @ 702/736-2822!

This is classic:). It <could> be a termination or cable problem, but
assuming you have checked this out, you have a DMA buffer problem.
One, your machine does not have one at all, two, it is the wrong one
for you machine or improperly installed. The best thing to do is
purchase the buffer that comes with a Nemesis and install it. Probably
not something you want to hear as I doubt you can get one in a
reasonable amount of time unless Computer Direct has a shippment in.
The second best thing to do is get the diagram on how to install a
proper buffer mod from either Doug Littles Web page or Titan Designs
Web page. It is not exactally what comes with the Nemesis, but should
cure you problems as long as your running at 16Mhz bus speed.
What you describe above is exactally how your machine will act with
buffer problem. Lastly, I think I have seen two, maybe three people
here have problems with the SCSI controller chip, but usually that
manifest itself with the SCSI just flat-out not working.
>

The Falcon boots default with the speaker on and FULL volume. This is
probably what you hear at start up. There is an autofolder app around
that will turn off the speaker at boot up. Alternately, you can
disconnect the speaker and add an inexpensive external set for a much
improved sound. You won't need the autofolder app then. Use SAM to

control your external speakers.

What driver are you using? I think I remember you said you purchased a
Toshiba 2.5" IDE drive. You probably don't have the latest version of HD
Driver (noone does:) While V6.0 (common in the U.S) works good as a
driver (don't partition your IDE over ~490mb each part with the
software mentioned below) it dosen't do a very good job setting up the
IDE drives (IMHO).
If you can get HDX 5.04 to partition the drive and install AHDI 6.06
(not 6.061) that is your best bet. Next, ICD Pro 6.5.5 will work nicely too.
You can disable the IDE drive with one of the utilites included with
MagiC, or there are other alternatives. With the DMA (buffer problem)
I wouldn't recommend this now.
Your IDE errors however, are likely to be from transfering data from
the SCSI (CD?) to the IDE. Your bringing bad data to the IDE and that
might be causing the problem. Once you have a reliable patch
installed, you'll have to wipe you SCSI devices to rid youself of all
the bad data. You might get away using Edge or Correct to clean it up,
but only after the patch is installed. If you have something that you
would like to keep on the SCSI drive(s) simply don't use them anymore
until the patch is installed, and then try to rescue them.
>

Buffer mod (more than likely). It will cause all sorts of problem. See
any video glitches? Spots before your eyes?:).

If you can solder, the fix will cost you about two or three hours of
careful work and about $1.00.

Email me if you can't find any of the files or web sites.

I get that too on my Atari-made Falcon. Mabye the Scsi audio fix would
cure that, but I wouldn't bother with it myself.

> I have also had one IDE drive go out on me, but I don't believe it's related,

I think you can boot without the IDE by using a prg called Fastboot. It
writes code to the bootsector of a floppy. So when you boot with that
floppy, the Falcon skips the IDE check. Want me to email it?

> Sorry for the long-winded message, but I didn't want to leave anything out.

Don't have a clue about all these other problems :-(

Thanks Damien Burke for pointing out to some people the reason why some of us dont like revealing our real mail Addresses. As for the subject that everyone seems to have missed the point on. i own 2 Atari st computers. 1 1040 stfm and a 1040ste. unfortunately I have been using one to repair the other and now both have given up. I own the original of every game I have downloaded from the net and use with pacifist. As also pointed out we are talking games that were released 8-10 years ago and therefore can have no financial loss for the programmers. I would like to see anyone buy an original ST game today and honestly say the programer was going to get some of the cash. So as for pirate stuff.. read the small print in the copyright, you are allowed to have a backup as long as you own the original.

Many new toys have microprocessors (indeed a CPU with software and
an OS built in) which make them computers. True a 520ST is a "toy" in
comparison with the latest Ataris. Remember: "It's more fun to compute"
(with Atari). Don't you miss it? Go and give it a hug :) Indeed it is more
fun to compute!! All other platforms are boring. Not "toys" I want to play
with ;-).

Same problem here. I ordered a "Spooky Special" upgrade last October.
That's a whole year come Hollween waiting for NVDI 4 for MagiC Mac.
I called yesterday and she said for sure I will get it this month.
She sounded pissed that I called. You must have talked to her before I
did:). Gezzz I use to love to deal with her:(.
Both ASH and System Solutions can't figure out what the problem is as
it has been in stock for at least a year. I'm glad i'm only out $25.00
for now and i'm also glad they have an 800 number as I plan to run up
my $25.00 worth calling very often until I get my order or my refund.

Maybe we all will have to form a mutual business in the States to
order direct from ASH. Hell, I'll go for a German version over no
version.

I think you will find there never was a 95 data disk. The last
upgrade was an end of season 94 data disk. The only time I even saw
it was in a letter sent by the UK distrubutors Intelek to everyone who had
registered CM'93 with them.

You could always try and contact Intelek (although I doubt they can
help you now) the address is:

INTELEK
PO BOX 1738
BOURNEMOUTH
BH4 8YN

good luck trying to find a copy

My experinces with Toad in the past year have been very negative.
In the past I didn't mind paying a few bucks more because they had things
in stock, were very helpful and provided excellent support. Since they
have become primarily a PC operation, they seem to be milking whatever
Atari stuff they have for whatever they can get out of it and treating
their Atari customers like second class citizens. I have called regarding
a couple of their e-mail specials within a few days of posting only to
find the items "unavailable" or "sold out". If they only have one or two
of an item, it would be appropriate to say so in the posting.

Perhaps I should be happy though. Unlike others they don't have
my money for a product that they haven't shipped!

No stamina fellow, I've had Atari's of one sort or another since
late '79.

>OK, I liked it and I was happy with it, but let's face it:
>the Atari is a toy and not a computer.

So, by your reasoning, a Yugo isn't a car? It can't get you from
point A to point B? A 1960's vintage black & white Emerson isn't
a television? You can't receive programming broadcasts on it?

Not that I'm comparing my ST to a Yugo, of course :)

For what it is worth, my original Atari 400 is still being used daily
in a friend's commercial photo lab (He loves that monopanel keyboard,
what with the chemicals) every day, he has been using it to help earn
a living for over 13 years now - counting the time I owned it, it has
been running smoothly and accomplishing everything asked of it for
over 17 years. Some toy.

> normal) but still have problems with the mod switched on ONLY ON THE
> NET.

This is because the system isn't capable of handling the data being received at any high than 19200bps, on an unaccellerated ST(E). The reason for this is STING slows down the system (by 15% according to QINDEX) and the interupts aren't processed fast enough to get every character received.

I noticed a few dropped chars when using a BBS at 38400 (on an STE), due to the mouse going for walks. This caused some problems when downloading with XYZ.TTP, although it was solved by using GSZRZ with the mouse turned off. Due to the way the 'net transfers data, one missed char can cause a variety of problems.

The answer to this is either stay at 19200 for the 'net and switch to 38400 for BBSs, or get an accellerator.

I have owned over 2 dozen ST's, and still own 6 systems, plus "parts". I also own two PC's (a '386 PS/2 and a '486 33). If I put together all the trouble I ever had with ALL the ST's I have ever owned, it wouldn't compare with the trouble I've had with that damned 486! (All the ST's I sold to neighbors are still in active service; still computing; I don't deal in games at all).
I'm writing this on a MegaSTe (my regular internet machine) because the 486 won't reliably work. If I could sell both my PC's at part of what I have invested in them, I could and would buy my friend's fairly loaded TT system, and f**k PC's and their myopic apologisers! Another thing I like about Ataris is that there is NO MicroSlop Megalomania Ware involved!

Source record: 117433

I have to agree that Toad has seemingly adopted a course of purposefully irritating their remaining Atari customers in their continuing work to blow out their old Atari stock. I ordered an NVDI upgrade (the Postscript enabled version) back in June, after sending me the wrong software entirely, which they graciously exchanged, they sent me an old version of the NVDI upgrade, which was not compatible with the version I already had (I had 4.11, they sent me 4.10). After repeated ignored or misread emails to Jennifer, I was finally handed over to Systems Solutions, who took care of business in short order.

And, oh yes, the order for the three CD roms that I included in the same order as the NVDI was completely ignored, never filled, never sent. Any emails to Jennifer on this matter were either unanswered or answered in such a way as to indicate that they had not been read before responding.

In my opinion, Toad has purposely adopted a policy of trying to irritate their Atari customers into going away. Well, as far as I'm concerned, I've got the message.

To the people out there waiting for software from Toad, be aware that you may not be receiving the latest versions (if you receive it at all), as Toad is blowing out old stock, and not reordering replacements. They really want to sell you a Windoze machine with their Atari emulator.

Having been deeply moved by the death and funeral today of Diana, Princess of Wales, I thought I'd like to show my respect by doing something and this is what I came up with:

POPwatch v2.22 is now available from my web pages. There are no bug fixes or new enhancements. The version change is simply this;

POPwatch is no longer *freeware*. It is now *charity ware* and dedicated to Diana. If you like and use POPwatch then please send the equivalent to 10 UK Pounds or more to a worthy charity that Diana would have approved of!

Thank you,
Gary

This month? What is that? How long does it take to ship a simple piece of software? When I ordered Kobold. it was early in the week and I was told it would ship "this week, " and I thought that was ridiculous. There's no reason why an in-stock piece of software cannot be shipped within 24 hours; 48 hours at the latest. I don't care how busy they are. Of course, as it turns out, "this week" would have been nice!

MG> She sounded pissed that I called. You must have talked to her before I
MG> did:). Gezzz I use to love to deal with her:(.

:^)

Yeah, I used to be a big Toad supporter and have spent a ton of money there over the years. No more.

MG> Maybe we all will have to form a mutual business in the States to
MG> order direct from ASH. Hell, I'll go for a German version over no
MG> version.

No need. Systems For Tomorrow has given me GREAT service, and they have all the latest import software with up-to-date versions. They answer their email very promptly and have notified me more than once when they get something in stock that I'm waiting for. The only reason I didn't order Kobold from them was that they had just ran out at an Atari show. But as it turned out, I would have been better off ordering from them anyway, as they would have had it in stock and shipped long before now.

* LED v1.51 * For a good time call 702/736-2282!

I do have printing problems after insalling the FX card. Not with every program, but with Pagestream and with TechnoCad.

I moved my printer back to the old STfm and do the printing from there, it's a little anoying sometime, but I can live with that.

cheers

Sounds to me like you have lost the boot sector on the hard drive.
Depending on the harddisk software that you are using you should be able to
rewrite the boot without disturbing anything else.
Lacking that if you put the booter on a floppy and configure it to support
the partitions of the harddrive you can boot from floppy. Hope this helps.

YES, YOU ARE RIGHT, but any computer is NOTHING OTHER THAN A TOY !!!

YES, YOU DON'T NEED ANY COMPUTER, this kind of material stuff is not
at all necessary ... food is necessary, not computer nor toys !

But it seems you continue to play the game ... otherwise why should
you post here or everywhere else about a so evident subject ?

A COMPUTER IS A TOY
A TOY IS A COMPUTER
People (any) don't need a toy or a computer to continue to live.

but childrens like very much this kind of toys.

Fool you twice? How about three, four or five times?. I ordered
PGS from them when they said they had it in stock and could deliver.
After a month, they still hadn't delivered. I complained bitterly
and had a number of go arounds with the credit card company but
finally in the end, after 6 months, I received a call from Toad
asking if I still wanted the package as it was returned to them
as undeliverable. Funny... the address I gave them received mail
from all services daily was absolutly correct. I suspect that
Toad never shipped in the first place! I wouldn't order squat
from Toad anymore. On the other had, Chris Krowchuks, Computer
Direct, in Edmonton, gives fantastic service and delivers when he
says. He has an 800 number for orders, but I can't find it now.

This is an outstanding idea - well done Gary. It's such a shame that the
events of the past week should be necessary for such humanitarian displays,
but I think it's now up to us to support Gary's modest, but heartfelt proposal,
and for more of us who write software for the common good to join in with
similar schemes. Well done again Gary. I can think of one person who would
have approved heartily...

>That's TERMINATION ON or OFF

I misspoke! It's the power for the termination that's missing
from some SCSI adapters. And I don't know which.

Source record: 117338

: Here, here! I bought a P100, Win'95 box last year because I needed it to
: keep pace with changes in Steinberg's Cubase Score music software. For
: the first six months it gave me and the service technician nothing but
: grief - and this is a major brand we're talking about here. Prior to
: that I owned two Atari ST's - an fm and and e, which between them gave
: me seven years of reliable service!

I've got a P200, and a Falcon 030. The P200 is for playing games that
aren't yet avilable on the FAlcon (like internet phones, real audio, etc.)
I must say however, that as a music work station the Falcon is FAR from
a toy. It might be black and white rather than 16.7 million colors, and
it might not have all those groovy real time FX the Mac and PC users
boast about (the few that actually have working systems), but by dang,
it works every time I boot it up, and it works well! 16 tracks of CD
quality audio (on a 4meg system!)...well more than the Beatles had to work
with for a good chunk of their career! It's also worth noting, that in
order to get my P200 to do up to 16 audio tracks, I could afford to buy
two more Falcons and the gear to sync'um up! Also, for what that bloated
PC software garbage costs...I could add a heck of a lot of true FX racks
that don't require yet another Processor upgrade, yet another 32meg of
ram, an extra hard disk, etc..., and the racks can be used without
the friggin computer! Really, to go mac or PC at this stage of the game
is a waste of money unless you really need to keep everything you do in
the digital domain (real time FX is the focus here)...and even so, it can
be done on a Falcon for a bit less cash (thoe a bit more time) than the
others.

Oh well...enough is enough...
The biggest toy out there however is Windows 95! I have it, and it's
a lot of fun...but when it comes to work applications, it offers little
more advantage over even an old DOS box, or an 8 bit system. No computer
can work any faster than it takes a human to input information into it.
With that in mind...even the speed of an old 4mhz DOS box is terribly
fast!

Now if you're the type who simply wants to plug in everyone else's
information for brain candy, or whatever...then you're right...the
Atari most likely isn't the box for you. Win 95 simply tosses in a bunch
of flair to make you "think" you're really smart because you can click
four icons and get a "semi" informative report about the Iffel tower.
We Atari guys (most that I know anyway) are out there beating the bushes
in the real world, gathering that info and pumping it into our simple and
dull Falcon and ST machines at increadable rates...and our "toys" still
manage to display the notes/words/pictures faster than we can pump um in,
so I guess guess it all depends on if you're an input guy, or an output

guy. Some folks are out to simply consume information, and others are out to consume, process, and contribute through creativity and other forms of HUMAN interaction. We've not got time to piss around with worrys over the fastest and best computers/OS/etc, we just wanna get our work done.

Well...looks like I've wasted enough time on this...guess if I'm human enough to have a toy, like the Atari, I'm human enough to waste a little time on this advocacy garbage as well.

May the music be with you,
Brian

2886. Falcon won't boot MagiC in 256 colours

Newsgroup: comp.sys.atari.st
Date: 1997-09-07 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <18318086_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 117339
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

I've been happily running my Falcon in 640x480x256 on a SVGA monitor, using NVDI 4.11 and MagiC 5.11 for absolutely ages.

All of a sudden (since yesterday), my Falcon boots up in ST High mode ie. 640x400x2. I can then change res to 640x480x256 via MagxDesk's menu option. Fine. If I save that res from the Res Changer and reboot, I still get 640x400x2. ie. it makes no difference.

I've just reinstalled MagiC5.11 and NVDI, but no difference.

My MAGX.INF has #_DEV 5 27 (which I think is the same as it's always been).

Anybody got any ideas? I'm getting a bit desperate now :(

Gary

>

I think it is Release 1.1, it say's so in the txt file and in the FXSETS.FXB file.
Yes,- Pagestream 2.2 and TechnoCad 1.2 run in FastRam. Actually I use the TT version of TechnoCad.

As I wrote in another messg. I did not complete the installation yet, the DMA and the DPS clock is still to be done. It might help when I finish this. I let you know when.

cheers

Hallvard,

Thanks, apparently I didn't cancel my post in time :)
It does relate to Atari in the sense that I am trying to upload pages
for a web site, and geocities doesn't allow a passive (PASV) connection -
that's the only way Newsie uploads - anyway, I did post a different
message with a little more detail - If you would like to recommend an
alternate NG, I'll be happy to move it over there.

You have to set the enviromental variables also. I have a prg that
will set the MagiC inf file (I did the ger to eng conversion my self) Do you
want a copy.

The variables should look something like this the columns and lines
variables are necessary as is the #_ENV _PNAM=MAGICINF.PRG
#_ENV PROMPT=pg. I found this little program helpful. I use a TT my
friend uses a Falcon and works in 256 colours Fine

: BDC> drive) that has termination power on it, or use something like Link
: BDC> that supplies power, at least on my TT. I am not sure about the Falcon,
: BDC> tho.

This is only a problem if you use an ICD Link or similar host with no
other SCSI device on the chain. Yes, you can terminate a ZIP drive!
What is not supported is "Termination Power" which is where the ICD Link
gets its power supply from. On a FAlcon...no big deal at all, as the host
is internal...same with a TT if you're on the built in SCSI host.

If you wish to use a Zip drive all by its lonesome on a ST(e) and host
that needs "Termination Power", you just have to build a cable so your
host can leach power from someplace...like your joystick port, off your
ST power supply, a dedicated supply, or wherever, or, pop some other SCSI
device, such as a CD-ROM, or whatever, that DOES offer termination power
on the SCSI chain.

Tis that simple...
Brian

Just a little note to everyone that has a Falcon/TT/Hades...

the AniPlayer in the incoming directory of ftp.uni-kl.de works REALLY well.
It plays .AVIs and .MOVs, even better than M_Player, I'm afraid, at least
on my Falcon.

It played full screen .MOVs without any droppage. (Now all we need is for
Intel to release the codecs for Indeo and we'd really have something!!!)

Everyone check it out
later,

Hi all...

I've read the docs, read the posts, and tried lots of stuff, but Sting still won't work. Here's what I've done:

(My system is a Falcon with 14MB, running HSMODA07 and NVDI)

1. I removed all the modules except tcp, udp, serial, and resolve.

2. I copied the .cpxs and didn't touch any of them, except for serial.cpx, and making Sting "active".

3. I edited the dial.scr to include all the relevant stuff. BTW, I have a *static* IP address, which is different than most, it seems.

4. I edited the route.tab to include the line
0.0.0.0[tab]0.0.0.0[tab]Modem 2[tab]0.0.0.0

So, now the DIALER works fine and I can get "connected" without any problems or bombs, but when trying to Ping my ISP's nameserver, it sends out lots of packets, but none are received...the modem "send" light flickers, but the "receive" light is always dark.

While connected, I exited the dialer, and opened the CPXs...

Heres what I found:

1. In the PORT cpx, under Addressing-Modem 2, it has the Active box checked and it specified an IP address of 204.117.4.131 (which is my correct static address). Subnet mask is disabled.
Under General-Modem 2, the active box is checked and PPP is checked.

2. In the protocols cpx, under the Resolver option, it has the DNS server I specified in the Dial.scr, but under DOMAIN, it has stud.uni-hannover.de, which is obviously Peter's.

So, I then looked at the DEFAULT.CFG, and it had all kinds of Peter specific info in it...I hadn't touched this file up till now...was I supposed to?

I then changed Default.cfg to include my info, and rebooted: Result was exactly the same, except the protocol cpx now says 'agate.net' for a domain and no longer uni-hannover.

Help! Help! Help! What am I doing wrong? Up until the point of looking at the DEFAULT.CFG, I thought I was doing everything right, but now I'm completely confused!!

Hi Everyone,

I would like to retire my Atari 1040ST, 1M RAM w/ 40 Meg HD and mono monitor and offer it free to anyone who will pick it up or pay for shipping. Included are various manuals, including Starting FORTH, Mastering FORTH.

Please respond soon.

thanks,

-Maurice

Get out you text ed and fill in the details in both the DIAL SRC and
the DEFAULT CFG with the details from your STIK files rebot and
everything should work fine make sure that the route.tab file only has
the one line enabled eg

0.0.0.0 0.0.0.0 (port name) 0.0.0.0

My scripts below,

>

Don't be silly ;-) We all try to be very helpful, and there is plenty of
software on the net!

> * The most modern OS that will work well on a 520ST. Remember, I don't
> have a hard drive!

Remember, the OS is in ROM, so upgrading TOS means replacing the ROM
chips. The latest version that will work on your ST is 2.06. There are
upgrade boards available that allow you to switch between the original
TOS and the new one, which is useful for compatibility with older games.

Without a HD, and with only 512K of RAM, I would forget about MagiC,
Geneva, Mint, etc... which are modern multitasking systems.

>
> * A decent terminal program so I can get the ST on the net (Zmodem
> download would be needed).

There are several ZModem capable terminal programs (I'm not a
specialist, but take a look at a few FTP sites), TCP/IP PPP and SLIP
connection is now available with STinG, Web browsing can be done with
CAB (you'll need at least a meg though), Usenet and email and FTP can be
done with Newsie... There is other stuff too.

>
> * Manuals? Any old pro out there who no longer needs to refer to their
> 520 ST manuals? Even photocopies are welcome.

The manuals won't tell you more than how to copy a file, format a disk
and save the desktop. I'm sure you can figure that sort of stuff on your
own. There's a chapter about that in the Quick FAQ (see below).

>
> * Pin-outs and or manual for the color SC1224 Atari monitor.

Pinouts can be found here:

http://www.teleport.com/~atari/STinternals.htm#MONITORPORT

>
> * Music software for a MIDI keyboard (this is why I got an ST).
>

Just like on other platforms, the best ones are commercial, Cubase,
Notator, Logic... you often see people selling second hand copies on
this group.

Otherwise, Alchemie or Sweet Sixteen are shareware seqencers that can be
found on the net. I don't have the exact addresses, but they can be
found.

> Thanks,
> Jill

I suggest you take a serious look at my Quick FAQ (the address is in my
.sig). The ST can probably fulfill most of your needs. Don't give up!

There are many .MOD formats, so sometimes it works, sometimes it
doesn't. You'll have the most chances if the .MOD uses only 4 voices,
because that is the ST's limit.

To transfer files from a PC to an ST, just use a PC formatted DD 720K
floppy disk, unless it's a very old ST that uses 360K disks. In this
cas, you'll need to do null modem connection with the appropriate
software.

>
>

Never heard of stuff like that before. An ST should be able to read
MSDOS formatted floppies.

If there is a Zmodem terminal program for the C64, you should be able to
use the same on the ST to tranfer files.

As for connecting drives, I seem to remember that Commodore drives were
always quite special things, so I really don't think that they can be
exchanged with ST ones.

> Heard a rumour about an Amiga emulator for ST , anyone ?

No, that's not possible, because of the Amiga's hardware which is
slightly superior to the Atari's.

Apparently it's not just a driver issue. Atari did not fully implement
the parallel port on the STs, so it lacks several instructions that are
needed to communicate with a ZIP.

> I just use my Ste for fun, so convience with the PCs I have came first, so I

The SCSI version works fine, both on PCs and STs, but of course, you
need a SCSI board for the PC and a host adapter for the ST.

I got that, and it does seem to play .MOV's and .AVI's at least as good as
M-Player (and I've got the registered version), but did you ever manage to
get the tape recorder look to work? I can't seem to get it to do that! :)

From: Kim Andersen <dksoft@image.dk>
Message-ID: <VA.000002eb.005393da@kim->
Source record: 117368

Hi Michael.

You seem to know alot about the Falcon and it's SCSI handling.

Some days ago i swapped one of my Falcons with a friends, cause his Falcon is suffering from a _very_ strange problem, which i have never heard of before. (I knew about the problems before i swapped. Explain later).

The friend of mine which i swapped with bought an SyJet 1.5giga removable harddrive a few months ago. He then discovered the problem with the Falcon not beeing able to see this drive at all. My first comments was software problem. But after testing several kinds of hd drivers, i had to admit, this wasn't the case. I then borrowed the SyJet drive to test it on my 2 Falcons. No problems at all, (except HDdriver 6.3 wouldn't let me controle the drive, even though HDdriver could see the drive during an ID scan). This is where i started to get very interested in the problem. I made an deal with my Friend, (he needed the SyJet in his profession as an musicians), if i could get his Falcon to work on my system, then i would swap with him.
Obvious to say, his Falcon did not work 100% on my system. I did swap anyway.

On my my Falcon 1, (test with the swapped Falcon) i got an Quantom 1.8giga Hd running, a Sony 4-16Gig DatStreamer and a Pioneer 6 disc CDROM drive. Booting up is running fine. The HD drive is not given me any problems, the CDROM drive is also working perfect. An ID scan, using HDDriver 6.3, shows the HD drive, the DATstreamer and the CDROM drive plus ofcouse the Falcon's own SCSI ID. BUT! when i start Gemar (Tapestreamer program, startet using a SCSIdriver) i get an TimeOut error, probably from the DATstreamer. This _never_ happende with my own Falcon.

Now it really made me wonder what might be the problem.
Fact is, this Falcon won't run with a SyJet 1.5gigabyte removable Harddrive.
Fact is, it gives timeout errors with a DATstreamer.
Fact is, it seems to work with all other "normal" harddrives without any problems. Also CDROM drives does not seem to cause any problems.

On my Falcon 2 i got a 545Mb Quantom harddrive running, a ZIPdrive and my Akai S3000XL sampler. I have yet to test this Falcon on this system, (havn't had time), but i suspect it will give same kind of problems with the ZIPdrive, and probably also the Akai Sampler.
As you perhaps can tell, i'm trying to figure out, why it does behave like this. It's strange, as it seems to work, but still don't.

My questions is, (as you might have guessed) Why ?
And is there any kind of utility to set an diagnose on the SCSI chip inside the Falcon. I have a real strange feeling something is wrong inside the Falcon, and i really want to find the reason, even though it's not possible to change, it's

an experience we all may need in the future.

My question also goes to Uwe Semit, (you re the best i know around SCSI devices), and Peter Engel, (author of Gemar tapestreamer program, specially why his SCSIdriver make Timeout s, and then skip the DATstreamer). Uwe, i think you know the structure behind Peter s SCSIdriver. Infact if i recall correctly the SCSIdriver is base on the CBHD driver, (thats part of the TimeOut error message btw. It is an CBHD message).

As you can see, this is a real nasty problem. Thats why i desided to swap anyway. Understand it or not if you like. I like the feeling of beating the Falcon in any problem which might appear 8-)) but i need help on this one 8-/

2916. FS/T: Atari ST software [09/06/97]

Newsgroup: comp.sys.atari.st
Date: 1997-09-07 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <3417fa32.1428764@nntp.ix.netcom.com>
Source record: 117455

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 09/06/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped!]:
$ 5.50 Arkanoid (Taito)
$ 5.00 Art & Film Director (Epyx) -- $4 shipping, due to weight,
counts as 1st item
$ 4.00 Battleship (Epyx)
$ 2.00 Bobo (Infogrames / Terrific Software)
$ 7.50 Bubble Bobble (Taito)
$ 4.00 California Games (Epyx)
$ 4.00 Championship Wrestling (Epyx)
$ 4.00 Death Sword (Epyx)
$ 3.00 Devon Aire (Epyx)
$ 3.00 Dive Bomber (U.S. Gold / Epyx)
$ 2.00 Dragon Scape (Free Spirit)
$ 3.00 Final Assault (Epyx)
$ 4.00 GFL Football (Gamestar)
$ 3.00 Golden Path (Firebird)
$ 3.00 Goldrunner II (MicroDeal)
$ 4.00 Impossible Mission 2 (Epyx)
$ 4.00 Karateka (Br0derbund)
$ 3.00 Knight Orc (Rainbird)
$ 4.00 L.E.D. Storm (Capcom)
$ 3.00 Lands of Havoc (Antic Software)

$ 4.00 Last Duel (Capcom)
$ 4.00 Man Hunter: New York (Sierra)
$ 2.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 4.00 Metro Cross (U.S. Gold / Epyx)
$ 4.00 Paint Pro (Abacus Software)
$ 7.50 Phantasm (Exocet Software)
$ 3.00 Prime Time (First Row)
$ 4.00 Quadralien (Spinnaker)
$ 4.00 Renegade (Taito)
$ 4.00 Space Quest: Chapter I (Sierra)
$ 3.00 Star Ray (Logotron)
$ 3.50 Stunt Track Racer (Microplay)
$ 3.00 SwiftaR (Accustar)
$ 4.00 Techno Cop (U.S. Gold / Epyx)
$ 4.00 The Advanced OCP Art Studio (Rainbird)
$ 5.00 Warship (Strategic Simulations, Inc.)
$ 4.00 Winter Games (Epyx)
$ 4.00 World Games (Epyx)
$ 4.00 World Karate Championship (Epyx)
$ 3.00 Zero Gravity (MicroDeal)

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3 for the first game and $1.25 for each additional game, unless otherwise listed. If you order enough items I can weigh the order as a package, which might reduce the shipping costs. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your
order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address
(this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

From: tross3@hamtel.tds.net
Message-ID: <5ut0gf$33v@news2.tds.net>
Source record: 117458

Hi,

I'm trying to upload some files to ftp.geocities.com /pub/homestead
& this is the response I'm getting (clipped from my LOG file):

```
-> TYPE A
200 Type set to A.
-> PASV
425 Can't open passive connection: Permission denied.
PASV: 425 Can't open passive connection: Permission denied.
open_connection returns Connection refused by remote host.
```

Anyone know what is going on? And how to correct it?

Terry

They shipped my AdSpeed board relatively promptly, but that was 2 years ago. I always found their voice-mail really difficult to navigate, particularly when calling long-distance from up here in Canada.

However, when actually in touch with howard Peters the tech fellow from ICD, he was most helpful.

2922. Re: Help: Notator 3.xx printing at 600 dpi

Newsgroup: comp.sys.atari.st
Date: 1997-09-07 00:00:00 UTC
From: ag352@chebucto.ns.ca
Message-ID: <5ut3nc$8j7$2@News.Dal.Ca>
Source record: 117461

That might not be so easy. As it was back in the days of 24-pin dot printers and 300 dpi lasers when all that code was written, we could be out of luck. Part of the problem lies in the fragmenting of the old C-lab organization into the 2 firms E-Magic and C-LAB. That all happened just at a time when technology was moving forward in several areas, particularly the entry of 600 dpi lasers into the relatively affordable home market.

You can try printing as a GEM.IMG and then importing tha page into Calamus 1.09N or Calamus SL, both of which have HPLJ4 compatible drivers. But the page might not be the size you want. Also a Notator page turned into an IMG file is enormous in bytes.

Let us know if you succeed.

>web pages.... :-(
>
Actually, I've tried to access it three times now, and have crashed every
time. This is due to a flaky set-up on my end. What I saw up until then
looked good though - it took me about 4 minutes to load, format and
display your main page while displaying graphics, and about 1 to 1-1/2
minutes with the graphics turned off. Satisfactory speed for me.

This was @14.4k with TOS 1.62 @ 8 megahertz, G+Plus, and the MaxiDisk
ramdisk, which slows things down a bit as it compresses the files.

2924. PASV not allowed - recommendations?

Newsgroup: comp.sys.atari.st
Date: 1997-09-07 00:00:00 UTC
From: tross3@hamtel.tds.net
Message-ID: <5ut9du$6ln@news2.tds.net>
Source record: 117463

I'm trying to upload some files to ftp.geocities.com - unfortunately,
that site won't allow a PASV connection, so I can't use Newsie

I've tried:
1: MG-FTP - crashes when I select the "OPEN" button
2: AFTP - Can't even load it, probably due to my early TOS version
3: CAB-FTP: Says it can't find the application it's trying to load
and exits to the desktop (Inside CAB, it says something
like "Can't find GFA-FlyDials" - can't remember exactly
what, it was a couple of weeks ago.)

Do I have any other options here? Last time I did anything manually
on the internet was about 15 years ago. I don't even know if I can,
going through an ISP, and I'll have to brush up on the procedures, if
I can go that route.

Thanks in advance,
Terry

I do believe you have misunderstood the previous poster's request...
He's
asking about the ST Book, an ill-fated notebook computer that Atari
produced
and then discontinued after a brief (one month?) sales "blitz."

Atari fucked up, but then what's new about that?

Gary Priest (gary@the-gap.demon.co.uk) wrote:
: I have a ZIP drive attached to the SCSI port.

: If I boot my Falcon and there is no disk in the ZIP drive then I can't
: access it at all even when I put a disk in. I have to reboot. All I get is a
: gemdos error (can't remember which one, something like invalid drive).

: If I have a disk in the drive with say 3 partitions, and then eject it and
: insert a disk with one partition, and try to access it, I get the same
: gemdos error as above. :(

I have a SyQuest 270MB removable drive on my TT with HDDriver, and
sometimes I do observe similar problems. Usually, however, swapping
cartridges "on-the-fly" works fine.

Occasionally, after I swap a cartridge, it appears as though no files are
present on the cartridge. Rebooting brings everything back to normal. I
have never figured out quite why this is.

In any case: remember to set the number of partitions to reserve
appropriately, and remember to set the sector size in the HDDriver setup
so that it is at least as large as the largest you will be using.

Hopefully this would help solve the problem.

STinG - Atari TCP/IP STack for Atari Computers
----------------------------------------------

**(Please fill out this form and mail to: dooley@infomatch.com)**

I will be compiling a STinG - HOW TO.. page So if you could also
send along your 'DIAL.SCR' (Delete your password before sending)
It would be much apprec.
---------------------------------------------------------------------

1) What type of computer are you running STinG on?
(Please enter only your MAIN Atari computer)

2) How much memory?

3) What is your Operating System?
(Tos/MagiC/NeoDESK/Warp9/NVDi)

4) Do you use SLiP or PPP

5) If SLiP.. Is it CSLIP?

6) If PPP.. Does your provider use PAP?

7) What do you use in your AUTO folder while running STinG?
(Please if possible give boot order of programs/patches)

8) If you use PPP does your provider send your IP address as text
or do you have to have your address hardwired?

9) If your provider assigns you more then the amount of addresses that
You are able to enter into STinG do you think this causes you any
problems connecting?

10)With all the question you answered above.. What is your percentage
of connection with STinG? 1-100%

11)What is the main problem you are having with STing?
(Please explain in as much detail as possible!

12)Do you want your e-mail address on the STinG help page with the
results of this questionare?

---------------------------------------------------------------------
Thanks for completing this questionare.. hopefully this will give
all of us a better idea of what people are doing wrong or right to
be able to run STinG

2935. Nemesis/Magic Printing - SOLUTION

Newsgroup: comp.sys.atari.st
Date: 1997-09-07 00:00:00 UTC
From: rgoring@REMOVEzetnet.co.uk

Hi All,

The solution to my Nemesis/MagiC printing problem has been found by a
couple of nice Atari users in Nest :-)

It's easy :-)

RUN GEMSPOOLER :-)))))))))))))))))))))))))

This must sort out the timing problems between Nemesis High and Magic :-)

Thanx to all who helped :-)

I'm still hoping that ASH will write a fix for MagiC :-)

But Gemspooler will do for now :-)

Yours Roy

2936. Yet more STinG problems...

Newsgroup: comp.sys.atari.st
Date: 1997-09-07 00:00:00 UTC
From: obroadway@cix.co.uk
Message-ID: <873636611.18516.0.nnrp-03.c2de4f5e@news.demon.co.uk>
Source record: 117475

OK, so I got it all properly set up, as far as I can tell...

Problem one: When I first start the Dialer, it thinks my modem is online, although it isn't. I have to click Disconnect and tell it to hang up the modem to cure this.

Problem two: connecting to my usual ISP, the ISP sends "CONNECT" and then seems to stick. Works fine with STiK, and logging on manually with Connect, so there must be something STinG is doing which is making it stick at this point. (I tried a different ISP, btw - Demon - and it was fine - connected and logged on OK, and all my clients seemed to work fine - but with my usual ISP - Internet Discovery - the one which I can call free at evenings and weekends - no dice. The connection to Demon seemed a lot slower than with STiK, btw.)

Problem 2a: STinG fails to connect about half the time. Either the noises from the modem suddenly become very "noisy"-sounding (i.e., far more so than usual) halfway through negotiation (this *never* happens with STiK), or the noise appears to go to completion and then it just doesn't connect - and the ISP hangs up a few seconds later (this only very rarely happens with STiK).

Problem 3: After a successful connection to Demon, when I try to Disconnect, the Dialer doesn't hang up the modem. It does this only when I click on Disable. (Incidentally, I notice that with STinG, you have to Disconnect and then Disable separately - unlike STiK, where Disabling automatically offers you the option to Disconnect - and more to the point, gives you the option of Disabling *without* disconnecting, which doesn't seem to be possible with STinG).

This hanging-up problem may be down to my dial script - I left the default of ",+++,ATH" for hangup, but I notice my STiK script works fine with just ATH, so changing this might solve it - but frankly, by this time I was fed up with fiddling with it, and not prepared to fiddle any further on a phone connection I was paying for, so I went back to STiK. If problem 2 can be solved, I'll have another fiddle.

I thought I'd give the STiK Dialer a try, but it told me not to use it with Multi-STiK, which means nothing to me.

Any ideas/solutions to any of the above?

Ollie

Sorry, i use my fx-board a long time, but i don't have any trouble while printing.
Sure that's not a problem of pagestream or technocad?
Last is a realy old software..
(I can't tested, i don't have pagestream or technocad)

Also a lot of other software will run & print fine.

> I moved my printer back to the old STfm and do the printing from there,
> it's a little anoying sometime, but I can live with that.
>

Right, that's a help, but nor a exzellent way.
Which FX-Driver do you have? Release 1.0 ?
Pagestream ec. are running in FastRam?

There are too many horror stories about Toad fooling people
and witholding their money for impossible amount of times.
The fact that Jennifer just gave birth is no excuse for any
lame service and deceitfulness.

However, given my recent experiences with Computer Direct,
I tend to beleive that it's just ASH and System Solutions
not bothering with America anymore (FYI, SysSol are those
translating ASH stuff if/when they expect profit from any
given peice of software).

Given other friends (mainly Australia, Canada, United-States)
have had horrible stories with both Toad and System Solutions
(even worst stories when trying to order direct from Germany)
my best guess is, if we want further support for Atari, we'll
have to return at software coding and hardware hacking, right
here WITHIN AMERICA.

Where have Bill Penner, Scott Sanders and Eric R.Smith gone?

It's just a matter of taste really. But Geneva *does* have some problems with E-Gem programs, where dialogs are incorrectly displayed even if you configure it to maximum AES 4.1 compatibility.

My experience with Geneva is that it's better than MagiC when it comes to stability and compatibility, it's also much easier to install and configure. In real life it also feels just as fast as MagiC.

MagiC has better multitasking, although for normal use (I.e. just have several programs loaded and switch between them) this doesn't matter. It's also better than Geneva if you have TOS < 2.06, as it replaces the whole OS and not just the AES.

But MagiC is much more expencive than Geneva, and while you have to pay for MagiC-upgrades the upgrades for Geneva are free :-) The support from ASH (publishers of MagiC) is also extremely poor, atleast compared with the excellent support from Gribnif. I had some problems with Neodesk 4 last year, and Dan Wilga at Gribnif was very helpful. ASH hasn't even bothered answering e-mails...

I Must disagree that Geneva is more stable then MagiC 5.11. I have
both the latest release of Geneva 6 and MagiC. Geneva still crashes at
unusal times uses a lot more memory and still has problems with
programs that work fine under tos and MagiC.

Geneva is excellent but magic is slicker easier to set up etc. If you
have access to the German BBS you can download the updates but they
are german ones currently. ASH home page is gradually adding English
pages etc which will help in the future.

GemView can handle many different formats, including GIF. There was also a shareware viewer called Speed of Light, which I think was able to convert into GIF.

>
>Any suggestion ?

what machine ?...do you want to do this on a PC or ST ?

If on ST then theres lots of programs that will convert to GIF or
simmilar, someone else will list them as I dont know whats shareware
ect,

If on a PC as seems likely then the best answer is to install an
ATARI emulator, the Gemulator 96 demo or the latest version of
PaCifiST will both do, instaling an emulator sounds a little drastic
?.. not at all, a two minute jeb and very easy,and very small in HD
space, then you have access to all the ATARI software that will
convert,

Most PC art packages support IFF format, I know Paint Shop Pro does,
a hell of a lot of ATARI art packages save as IFF as well :)

If you need detailed help then mail me, I am always converting so
will maybe able to help more with more details of what you hope to
achieve :)

> I misspoke! It's the power for the termination that's missing
>from some SCSI adapters. And I don't know which.

I miss some mails before, i'm sorry.
But you're right. I you MUST have a complete TermPwr wireing from
you Host / any other device.

Otherways your ZIP do not work well.
The best way is to use a host adaptor how was support TermPwr.
(Also Falcon and TT have it allready)

I chance my ZIP from Falcon or 520ST (with LINK'96) to my Mac or a old PC Notbook
with a external DB25 SCSI Port. That works allways well.
First time after connect that ZIP to my ST i must kick my old VANTAGE I Adaptor..
(One of the DMA/SCSI adaptors without TermPwr Support)

What kind of atari / host adaptor do you have?

Regards, Robert

Linux is available on CD-ROM, complete with easy installation. I don't have
it but I've heard that it requires a 68030 and a math co-processor. (or maybe
its just the math co-processor) I reckon it takes a pretty powerful Atari
to get decent speed...! Hope this helps... :)

You should also make sure that the drive has both parity and termination
disabled. The Quantum LPS105 I had in my MSTe wouldn't work at all until
I removed the termination resistor packs.

I've no idea what the above variables are. They certainly don't have
anything to do with booting in 256 colours (which was my problem).
I've looked back at previous magx.inf files of mine and I have *never* had
these defined. Anybody got any ideas what the above vars are used for?

Regards,
Gary

>hang up the modem to cure this.

I had this problem at first, it disappeared when I sorted my AUTO
folder and ensured STING.PRG loaded after the HSmodem programs. This
also let me connect, whereas before the change STinG would go through
the login procedure but flatly refuse to resolve anything or talk to
the other end, so the other end dropped the line after a short time.

>Problem two: connecting to my usual ISP, the ISP sends "CONNECT" and

Not sure about this, but you might find things improve if you follow
the above tip. WRT speed, try leaving the following lines blank after
the = in DEFAULT.CFG:

MSS
RCV_WIND
DEF_RTT
DEF_TTL

Someone suggested it here and it speeded things up for me.

<snipped other queries on which I can shed no light>

>Any ideas/solutions to any of the above?

Apologies if you've already tried the above.

>> problem?

I had that problem with my Mega, it turned out that it didnt like the monitor
being on top of it.

Pulses from the LOPT in the monitor were being picked up by the foil
connector on the FD drive, and as this cable is exposed outside of the shield
progresivley as the disk is formated, the problems seem to occur near to the
end of a format.

Try to move your monitor further away from the machine and re-test

Something strange is happening here. I get exactly the same "not found" response at home using CAB 2/OVL 1.26/STinG, but it's perfectly accessible when I try it at work using Netscape. I used to be able to access it OK a few weeks ago from home, so I'm getting suspicious about the OVL. It's not STinG as I'm pretty sure I tried reverting to STiK at one point after it seemed to have disappeared.

Anyone else having this problem?

Hello all,

I've been ignoring my Falcon for a few years now, but I'd like to put it
all back together so I can use it to program my Jaguar :-))

I've sort of got used to my SGI now, so what I thought I'd do would be
to link the two machines together with MiNT-net (or Fenix, when it
becomes
available) so that I can program in the relative comfort of Irix, and
download onto the Jaguar from the Falcon.

I've set up a serial line between the two machines, and with terminal
software, I can log into the SG from the Falcon at 38400 baud, using
Connect. So far, so good. I've also set up SLIP on the SGI in the
standard
way, so that you log in as 'slip', give a password, and the SGI says
'starting SLIP' then you have a SLIP connection active. What I don't
seem to be able to do is get the SLIP connection to work when inside
MiNT.

I've tried the slattach stuff, but figured out I needed dip. I
configured
dip, and it just hangs. I'm using the device /dev/modem2, which at least
responds with garbage when I use minicom to talk to the SGI.

(garbage: it returns a few random characters after I press return - I
assume
this is the 'login:' prompt from the SGI, after it's been munged
somehow)

So, I think I'm using the correct device, I think I have the correct
software (dip), and I think the line works ok. The only thing I can
think of is that
the MiNT drivers can't handle 38400 baud.

I seem to remember that ST's (Falcons too ?) couldn't drive the serial
hardware at high baud rates... Is this my problem ? And if so, how do
people use modern modems ? Certainly Connect has no problems, or is this
just clever programming on Connect's part ?
```

I looked through the version of MiNT's tty.c, and it seems to indicate
the
serial lines can go as high as 230kbaud (wow!), but maybe it needs a
.xdd
driver...

Any help gratefully appreciated.

ATB,
Simon.

Yes, there is. There's a good CD from Germany, I've tried 16/32
in good ole Blighty, but they say that they're waiting for new stock to be
shipped. Other than that, there's and older version on the Compendium CD.
I haven't tried either yet, the Compendium also has NET BSD and MiNT.
The UMICH site has Linux, but that'll be a lot of FTPing and floppies...

I checked that and it looked ok.

I have actually kind of discovered what the problem was. Tonight I zeroed my
boot partition and reloaded HDDriver, NVDI, MagiC etc.etc.
Then I noticed the problem which caused the colour booting problem. Somehow
the #_DEV line was at the very top of my magx.inf file. This was causing the
problem. I moved it back to where it should be, and hey presto, problem
solved. God knows how it got corrupted.

Thanks to everyone who responded to this, my Falcon is now booting in 256
colours again. Hurrah :-))

Another things that strikes me from reading these millions of
messages about that you can't get STiNG to work is. Why doesn't
anyopne use PPP-Connect which commes with CAB? As most people,
I guess 99%, who uses the internet uses CAB this sounds like
the obvious choice. From the few people I have heard who uses
PPP-Connect (I guess not many have bought version 2.5 of CAB
which also is suppsoed to be much much better than previous
versions and which is sad) they have had no problems what so
ever and have got it up and running in less than 10 minutes.

Maybe you should all go and buy a copy of CAB 2.5 and see
for your self. And since you all use CAB anyway it sounds like
something you can't afford to miss.

CAB 2.5 is available in about any language you could possible
speeak and ASH told me that PPP-Connect is available in english.

Just my two cents.

And I don't use either if you wonder as I havn't got a internet
account at home.

Here, here! I bought a P100, Win'95 box last year because I needed it to keep pace with changes in Steinberg's Cubase Score music software. For the first six months it gave me and the service technician nothing but grief - and this is a major brand we're talking about here. Prior to that I owned two Atari ST's - an fm and and e, which between them gave me seven years of reliable service!

Cheers,
Murray.

Sounds like your NVRAM has changed for some reason. Try and reset it with
the propriate program (BOOTCONF.PRG, NVRAM.PRG or whatever) and see if it
helps.

Hallvard,

I agree, you take them for granted. But yes, it's all entered correctly,
it's just that Newsie only uploads to ftp sites using a passive connection
(it's listed in the "Known Problems" section of the documentation),
which geocities doesn't accept (I have uploaded to other sites, btw).

Now, if I had MINT or something of that nature, I'd have no problem, but
since I lost almost all of my hardware (it was in a friends basement
during some severe flooding in Reno, Nevada) all I've got to work with is
an old backup, a 1040 with a single 720K drive - so MINT is out of the
question.

I'm on my way though, I think - I downloaded Oasis2, which I hadn't really
considered before because of it's size and my lack of hard disks - with
a little playing around I've got it all ready to run (even if I *can*
make a cup of coffee while it's getting ready) - It loads into Maxidisk
at bootup as a self-extracting ZIP file with my configurations set, then
auto-runs to extract - I've got it to the point of logging on and
getting the IP address, but then it doesn't seem to do anything useful,
even though the packets are being sent & received, I don't actually seem
to be logging on to the site - but I'll work on it.

I'd be willing to just do it through a terminal program, but I've got to
call my ISP to see if I can, since I have a dial-up account.

er.... sorry about the book... got carried away :)

Terry

2999. Auction: Atari 1040STf units (2), here, not eBay

Newsgroup: comp.sys.atari.st
Date: 1997-09-08 00:00:00 UTC
From: Jason Whorton <chesster@pcl.net>
Message-ID: <01bcbc11$de3ae980$4f1bb9ce@default>
Source record: 117376

Hello. I have two Atari 1040STf units that I am auctioning off. I have no monitor to test them with, though each does light up and the disk drive spins and lights up when powered up. I can't test them any further without a monitor, so these would be as is, except for what I have already mentioned. One is in fine shape cosmetically, the other has a few cracks in the top vented part. The minimum bid for each unit is $2. Shipping cost are not included. Money order is the only form of payment I can accept. The auction ends Sept. 21st at midnight Central time. Updates of the auction will be by e-mail only, unless you are having e-mail problems, then post a message to the newsgroup, and I will post one back to you if necessary. Please e-mail all bids or questions to me chesster@pcl.net. Bidders will be notified of changes in bid status by e-mail as often as possible. Unless something happens, this will mean once or twice a day.

Thank you,
Jason Whorton

3000. STinG Question!

Newsgroup: comp.sys.atari.st
Date: 1997-09-08 00:00:00 UTC
From: dooley@infomatch.com
Message-ID: <5v01tb$2ur$1@berlin.infomatch.com>
Source record: 117377

Hi all!

As some of you might be aware.. I am compiling a STinG how to list to put up on a web page to try to help people solve their STinG problems.

A problem alot of people seem to have is not knowing what to add for the CLIENT_IP for a PPP connection that the ISP assigns a different address for each time the user logs in!

I have seen this:

CLIENT_IP = 0.0.0.0
CLIENT_IP = 127.0.0.1
CLIENT_IP = (Some people put the nameserver for their ISP here)

Which is right?? Or are they all wrong??

Please reply to E-mail: dooley@infomatch.com
Or if your useing a shell account hit (SHIFT + R) For Reply!

If you have any information on STinG that might help with setups/connecting.. PLEASE send to the e-mail address above.
And to help matters even better.. Send your DIAL.SCR and DEFAULT.CFG to the same mail address and PLEASE specify what kind of connection you use being PPP, PPP/PAP, SLIP, CSLIP.

Thanks
Johnny

All info will be posted on a web page for all to access to help solve their STinG problems!

Cya!

no need to continue quoting myself...

Well, maybe you're wondering what I did. The concensus of the
response postings is that 3 chip SIMMs don't work with Ataris. So, I
took them back and got a refund.
I don't think any PC dealer here in San Diego carries 8 or 9
chip 1 Meg SIMMs. So I guess I'll have to drive 20 miles to the
nearest Mac dealer. They should have them. Macs, like Ataris, have
allways used non-parity memory. Only with Pentium and the later 486
motherboard designs did the PC world finally wake up and see the
virtues of dumping parity memory checking.
Even if I don't find SIMMs that will work in my Atari, it's no
big deal. The MSTE will still most everything I need with just only 1
Meg (4-256k SIMMs). The upgrade would have made (entire disk) high
density copying quicker and allowed me to use NeoDesk 4 (and still
have useful memory left).

Thanks Again

Related issues: In case anyone is wondering, I think dip
switch 7, the only switch on, enables high density floppy operations.
Assuming you have the Ajax chip and TOS 2.06.
My first Atari was a 1040ST. It had mixed memory chips of both
120 and 150ns. Yet it worked fine for six years.

THE ATARI ST QUICK FAQ
v1.4 - June 2nd 1997

In order to save bandwidth and avoid comp.sys.atari.st newcomers asking the same questions over and over again, here is a quick list of the most Frequently Asked Questions (FAQ) and, hopefully, useful answers.

http://www.geocities.com/MotorCity/2090/quickfaq.htm (USA) HTML version

or

ftp://ftp.sn.no/user/hallvart/atari/info/quickfaq.txt (Norway) ASCII version

If you don't have web or ftp access, send me an e-mail at the following address, and I will be happy to send the FAQ to you:

bales@hol.fr

This announcement is manually posted once every week.

3008. Giving away 256K SIMMs (Europe)

Newsgroup: comp.sys.atari.st
Date: 1997-09-09 00:00:00 UTC
From: bales@hol.fr
Message-ID: <19970909224933477015@ppp29.tou.hol.fr>
Source record: 117137

I have four 256K SIMM memory expansions to give away for free. If I was to sell them, it would be so cheap that it wouldn't be worth it.

Simply adding two of these SIMM boards will expand a 520STE to 1Mb.

I'll happily donate the two sets of two SIMMs to the first two 520 STE owners to reply to this by email. I'm limiting this to European Union countries because I don't want it to cost me more than a stamp for postage.

3009. looking for jpg viewer for ST

Newsgroup: comp.sys.atari.st
Date: 1997-09-09 00:00:00 UTC
From: fred <fredu@america.com>
Message-ID: <3415F0A8.6DEB@america.com>
Source record: 117138

This may be a duplicated post and it may not. My shell account kicked back and said not posted, so who can tell?

Anyway, my neighbor uses his Atari SY for midi work in clubs in the area. I've have up to 6 ST machines at one time, although I have long since defecated over to the PC world. That is not quite a typo as many will appreciate :)

I would like to assist him with expanding his world of Atari and he has no web/net access and I have volunteered to provide a connect for specific requests.

Is there a viewer available for the ST to view JPG format images on a color monitor? He has both units, so that's not an issue.

His machine is a 2 meg STe, I think, might be a plain vanilla ST, though.

Please to email me at fredu@america.com with a specific URL or ftp location if at all possible. I have searched a number of locations and atari web pages with minimal luck so far.

thanks in advance

fred

3011. HELP Matrix MICO/NOVA VDI

Newsgroup: comp.sys.atari.st
Date: 1997-09-09 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5v4f9p$ks@alexander.INS.CWRU.Edu>
Source record: 117140

Help! To those of you who have seen related posting on this
earlier, I now have new information, but still need help.

I have established now that it is a Matrix MICO car4d,
although I don't know which one yet. i have also gotten it to run (sorta)
but it is obviously set up wrong for my terminal. The picture is
too wide, and has black streaks in it. I found I have a disk for NOVA VDI
but the disk is apparently corrupted and wont install. I understand the
NOVA stuff works with the Matrix cards, too.

If any of you wise souls out there have experience with
ANY of this stuff, please let me know.

Thanx in advance.

No problems. I have been using ISDN for almost 2 years now, fully controled
by the Falcon looking just like a normal dialup line.
ISDN is bascily the same as normal PTSN phoneline, except it's going a hell
alot faster ofcouse 8-)

GEMView as I recall allowed you to save GIF files. While not PC specific
like PCX or BMP, any PC gfx package worth its weight will read GIF files
and save them out in other formats.

Hi there

I have been using Cops for 8 months with no conflict or bombs etc the
current ver is 1.7 You have to set the flags for the cpx to boot init
or mem resident etc make them non memory resident this will cure the
problem. The same thing would happen under the old XCONTROL or ZCONTROL.

The distrib-kit is outdated. You should go for KGMD instead, it's modular
and you can download/install just the parts you need.

> Anyway, if someone out there could give me a brief walkthrough of what
> I need to do before running MiNT, ie what drives should be configured, how
> many partitions my 42M HD should have (it's empty, and currently has just

Make two partitions, one very small (5Mb should be fine) for the
autofolder and accs, and one for MiNT. Then download the parts of KGMD you
need (I believe they are "basic", "net", "compiler", "man", "x112r5" and
one or two uucp/news packages) and install them. Have a look at K.Ellis'
homepage (www.primenet.com/~kellis/) for more info and english
instructions.

BUT, in order to use MiNT you really need atleast 4Mb RAM! So if you have
less, a RAM-upgrade really is recommended. This applies to all "serious"
use (I.e. everything but games).

> Please help me! I've absolutely fallen in love with the ST series.
> I went from playing with a friend's ST to owning my own complete system
> in about a week and a half.

:-) It's a cool machine, isn't it? My Falcon is at canmpus now, and I have
this old Mega running Freeze Dried Terminal at home that I use for reading
mail and news (I'm sitting in front of it now). I love it :-)

> PS anyone know where to get TOS upgrades in Pennsylvania?
> ...okay, how about an up-to-date mail order catalog for hardware?

Haven't got a clue about US, but in the UK TUS (The Upgrade Shop) is a
good source for hardware, and in Germany you should contact Woller & Link
(www.inx.de/~w+l/) which has lots of cool stuff.

Ok. This has been stated a few times by Peter in these groups. Do *not* set
the PORT to ACTIVE for DIAL-UP connections. Leave it inactive. The dialer
will activate it. The activate bit in the CPX is purely for networking your
machine to another via a physical cable.

I can't help you with this problem I'm afraid. I believe people are using simliar spec machines to yours with STiNG. The *major* problems appear to be with STiNG and Falcons. I've got a Falcon and STiNG doesn't come close to working,

>other info can be obtained from MY STinG HELP! Homepage at:
>http://www.geocities.com/Hollywood/Academy/2034
>
>There are other people's infomation/scripts/configs/etc.. including mine!

Been there. Didn't help me ATM (no Falcon users), but it's a nice idea!!

Are there any Falcon users out there who have got STiNG working??????

Cheers,
Gary

<snip>

Actually, Everest will happily use outline fonts as long as they are
monospaced and not proportional. And it has the option of printing out
via GDOS/NVDI too, though you can only use the one font at a time (the
monospaced one you chose for the screen display IIRC). This can be
handy if you are having problems printing special characters like the
pound sign etc as NVDI prints it as it appears on screen.

3024. STiNG on TT Modem 2 port?

Newsgroup: comp.sys.atari.st
Date: 1997-09-09 00:00:00 UTC
From: Dennis McGuire <mcguired@moose.erie.net>
Message-ID: <Pine.LNX.3.95.970909224643.10825B-100000@moose.erie.net>
Source record: 117153

I'm having problems trying to use STiNG on the Modem 2 port of my
TT. I am using dialing scripts that have been successful on my 1040 STe
for both SLIP and PPP connections. I've changed the scripts and ROUTE.TAB
file to call out the Modem 2 port, but I can't make any connections at
all. Is anyone else running STiNG successfully on Modem 2?

Message-ID: <5v2fmgkkh2@brokaw.wa.com>
Source record: 117285

Hi Kemosabies,

Anyone know much about the possiblites of getting a Falcon setup with an ISDN account? My ISP is offering a "new" 64k dialup ISDN (1 B-channel) unmetered access and dynamic IP accounts for $40/month. I just got this e-mail from them, so I haven't got any other details. I haven't looked at ISDN modems before, so I not sure if connections are possible...

3030. STinG/Falcon 2/4 bomb bug?

Newsgroup: comp.sys.atari.st
Date: 1997-09-09 00:00:00 UTC
From: csilver@kendaco.No.2.Spam.telebyte.com
Message-ID: <5v2fj8kkh1@brokaw.wa.com>
Source record: 117286

Hi All,

I now definately think there is a bug in StinG that causes some people with Falcon's to get 2/4 bombs with STinG with some PPP accounts. I have a 1040ST and Falcon both of which work well with STinG, but only with a slip account. My ISP uses PAP protocol with it's PPP accounts and this along with it's dial in procedure won't allow me to get the dynamic IP using STinG. With the same default.cfg and dial.scr (except for Modem port, and route.tab) my Falcon bombs about 55sec after login/connect. The 1040ST doesn't bomb at all. Neither can grab the IP, but why does the Falcon bomb(2 with NVDI or 4 without)? I've tried all the dial.scr's that others have posted, but it makes no difference. After login/Password my ISP immediately sends out the binary ppp data, so that's the main difference between my ISP and others.

I guess this is what's so hard for some to understand that have STinG/ppp working. If STinG doesn't work, you can easily go through 50 or more setup's trying to eliminate all the possible conflicts ;). I've tried that many and more just to eliminate even the most remote possiblity of conflicts. Nothing works; therefore, when I get back from vacation, I'll try a different ISP for ppp. Where I'm going on vacation, no computers :)

Regards,

Charles

Most of the good MIDI stuff needs 1 meg to run. Also you need the SM124 mono monitor for most of them. Chances are the TOS in your 520 is the dreaded 1.0, and that the floppy drive is only single sided.

best of luck with it.

Body handling: HTML body converted to readable text

Thanks to those who responded to my previous posts,
my MEGAFILE is now sold! ;-)

The following items remain FOR SALE/TRADE:

* 4160 STE (TOS 1.62, 4 Mb) ==>> ie: 1040 STE @ 4 Mb
* MEGA-ST 4 (TOS 1.04, 4 Mb)
* SLM 804 Lazer Printer
* STM 1 Mouse
* Softwares
DTP: Timeworks - Publisher
Soft Logic - Publishing Partner
Music: Dr.T - D-50/D-550 Editor
Dr.T - D-10/D-110 Editor
C-Lab - Notator SL 3.1

Offers from Canada and United-States only!

Preferably TRADE against following products WANTED:

* MEGA-STE (TOS 2.06, 4Mb Ram, Internal HD)
* STacy 4 (TOS 1.04, 4Mb Ram, Internal HD).
* Crazydots-2 graphic card for TT (or equivalent ET-4000 card)

NOTE: Canadian banks cause troubles for cashing foreign currency
of any kind, including American. This can be avoided by an
electronic fund transfer (Western Union or similar), which
is usually cleared within 48 hours of transaction.

Nonetheless, if you're interrested in trading your MEGA-STE
or your STacy, we can arrange something, as no money would
be trading hands accross the border.

Complete list of items I'm selling or looking for on my homepage.

It can be found on the lip6 (ex-ibp, ex-cnam) FTP site at:

ftp://ftp.lip6.fr/pub/atari/telecomm/ghostlnk.zip

beware, this FTP is quite picky with passive connections. It's better to
use a proper FTP client to access it.

Hi Steve,

Nice Sig. I'll have to remember that. I just watched Cujo (for the 20th time:).

About your PAK. I have a T36 (36mhz 68000) that I want to install in my MSTE.
Problem is that I need an adapter to go from the standard 68000 pinout to the
PLCC like in the MegaSTE. Yor pack must have something like this, but I have yet
to locate a source to get the adapter. Any ideas on where one might be found?

Thanks,

Mike

> email:- sbarrett@indigo.ie

AFAIK, it's not possible.

THe first STs with TOS on disk had a special bootsector that loaded TOS
in RAM. Without this bootsector you can't do it.

We are still waiting for someone to make a TOS loader program to do the
job. I'm sure it's not a difficult task, but nobody has done it yet.

Considering the amazing Features of the Falcon for music, I think it would be a nice idea to write a software that would turn the Falcon into a fully fledge midi expander. Some kind of "EMULATOR III". As most falcon have a hard drive & at least 4megs of memory, it could be an interesting machine, and I am sure the dsp can at least compute 8 16bit tracks in real time.
Also, I woudl be great to be able to load the Soundfonts that are used by the AWE32/64 sound board

If anybody is interested by this project, please send me an Email. I would be most willing to go back to Machine Code programming myself, but I have no knowledge of DSP coding, so any help in that field would be immensely appreciated.

Please give me some feedback !

Thanks,
Steph

Hi,

Brad of Best Electronics is traveling to Germany in October. I recommend anyone wishing this, or other fine German products to call and encourage him to pick up an inventory. He seems like one hellovaguy:). Today on the phone he mentioned he is in contact with one of the persons that use to hold the Atari Shows (Atari World) at Disney Land. The idea is to have a complete (Pong to Falcon+) Atari show in the future. Maybe with a little comunity $upport we could pull something like this off.
Anyway, maybe with enough orders, he would be willing to bring back some nice software and hardware.

Mike

Ah, I'm not alone. I'm using the same kit.

but it's perfectly
>accessible when I try it at work using Netscape.

Do you use the same ISP from work as you do at home, John? It's a bit
like blundering in the dark but I've mailed my ISP to ask whether it
may be down to them. If their name servers are not being properly
updated it woould explain things.

I used to be able to
>access it OK a few weeks ago from home, so I'm getting suspicious

Why, I have at least three TOS loaders in my collection. I am not sure
if they work with every version of TOS, but you may try two of these
(the third one is a bit longer). They need the real TOS to be present in
the root directory (or AUTO) with the name TOS.IMG or TOS1.IMG.

If you look at the reply you will see it is sent from an ATARI BBS, (All at Sea BBS is one of the top 3 BBS in this country I am told) and they usualy only take ATARI newsgroups, so the only way to test is to post here,
The reason a number is used is to keep track I would think, as soon as one arrives, then no need to test again,

See! a perfectly reasonable explanation :)

This is a common problem on the Falcon. It seems to get worse when using
2 SCSI drives
at the same time, btw.

There is a new version of the hushi harddisk driver that sends an SCSI
reset after any error message now. That way the harddisk will react to
the retry of the driver correctly which means everythings works fine
again.

I read this in the latest edition of Atari Inside, but had no chance to
test it so far. If anybody is interested where to get that driver, I can
look up the address.

Harald

Depending on the tracker used to create them I believe you don't have to
convert them, 4 track PC mods can be played on an STFM/e using ProTracker,
there is also a new [or it might be old] .MOD player that play's 8 track
.MOD's on the STe.

c> If I find an ATARI ST program on the net, how do I get it on to a
c> ATARI ST disk? Can I use a Null-modem cabel?

As long as you format a DD disk to MSDos you'll be able to read it on an
ST :))

Using a Null modem cabel you can use Ghostlink to transfer from PC to
ST...but it's slow going ;((

If anyone knows better tell the man eh? :)))))

It shouldn't crash because of lack of memory.MS-DOS programmes must ask the OS
to use memory.It's up to MS-DOS to tell it where the free memory is.
Actually,this is how the Atari works too.
PKZIP should just get a error from MS-DOS and exit.And PKZIP (2.04g) uses XMS
memory.(and EMS,but nobody uses that anymore)

How much MS-DOS and XMS memory do you have?

Of course Sting serves a purpose and is very useful _if you get it to
work_. Most ordinary users would have a very hard time with this. The
documentation is a nightmare (but there are lots of even worse
nightmares). Try to imagine someone who knows nothing about computers, and
just wants to surf away on the Internet.

Strange. Most of the tips here talk about changing things with an editor.

I spent more than an hour yesterday, configuring the dial-up stuff on a
Win95-box. Missing binaries, wrong paths in the install-scripts, countless
reboots...

> In the case of Sting it seems to be more like "tinker-and-weep"...

Like all other dial-up software I've seen. There's just too many variables to
make it plug and play. If the ISP uses PAP/CHAP correctly it's very easy to
set things up (Except with Win95, where you have to install "networking card"
and protocols and a whole lot of stuff), but very few does.

3061. Realtime Clock For STE ?

Newsgroup: comp.sys.atari.st
Date: 1997-09-09 00:00:00 UTC
From: Alan Swanson <emdu02@holyrood.ed.ac.uk>
Message-ID: <34156C67.E91@holyrood.ed.ac.uk>
Source record: 117317

The Dallas 1216E is a 28 pin clock designed to fit under a ROM such as in the ST, the Dallas 1216F is a 32 pin variation. Using the Areal software as in Hallvards list which uses a 1216E and has been fixed for some STE problems suggests that this is the way to go. However I was wondering about the fact that the STE has a 32 pin socket but with a 28 pin chip in it. I would appreciate anyone comments before I buy either one.

Thanks.

ALaN.

The subject line says it all! I'm looking to purchase MagicMac and sell off my old 400dpi Migraph b&w hand scanner with Touchup (very nice piece of equipment). Send mail to:

Oh, if anyone in the Boston area has a Mac using MagicMac that I can somehow arrange to borrow that would be fine too. I only need it long enough to get my data off a bunch of Atari formatted Zip cartridges. See, I'm running Calamus 95 on my Mac with Virtual PC (fun fun fun) but can't access my Zip disks because I stupidly forgot to copy stuff off before I sold my Falcon ;-(.

Let's face it, Sting and Stik are arcane mysteries. Some people get them to work, some don't, and nobody seems clear what the difficulties are.

Sting 1.06 is the only program so far that I've got to work with CAB (earlier Sting and Stik didn't work). And it works for me with the demo of CAB 2, but not with CAB 1.5.

I have an Atari Falcon030 for sale. The unit is in excellent condition and comes with the original box, software (MultiTOS, SpeedoGDOS 4.x, CalAppt, etc.), and manuals. The following software is also included:

Calamus SL (original disks, manual, binder)
TruePaint true color art package (disks, manual, box)
SimCity (disks, manual, box)
WordFlair II Document Processor (manual, disks)
SpeedoGDOS 5.0 (disks)

This system has been well cared for and is fully loaded with the most recent Atari internet connectivity software. An s/vga monitor adapter block is also included. Will sell for $475 - shipping free within the continental 48 U.S. Please e-mail me if you are interested.

Sorry, I can only speak for myself, but I do answer my e-mail and Oliver
Buchmann - as far as I know it - does that as well.

>The impression I have of Kromke (no offence) is that he/ASH isn't
>very interested in improving Falcon-compatibility.

It took us more than a year and a lot of effort to make it run on the Falcon
and that is because the Falcon hardware has these "funny hardware bugs" that
you mentioned. It's really a very nice Atari legacy. As you know we are a
small company and we have to concentrate on the major problems. If there is
any time left we can try to fix problems with hardware that is used by a
minority of users, but that is not very often the case. I honestly regret
that, but I do not see a way we can change that, since we cannot hire one
more developer to fix problems like these because the market simply doesn't
pay for it.

>I even had great
>problems with running MagiC on my totally unmodified (only the original
>Atari buffer-mod) Falcon, so don't blame it on the accelerator.
```

Sorry, but I don't know any standard problem that occurs on a clean Falcon. My information is that all the problems that have occured are fixed (either by MagiC bug fixes or fixes in the drivers used).

>It was easier to switch to MiNT/N.AES than disassemble MagiC...

I didn't mean, that you - personally - should disassemble MagiC. I said that we would appreciate it and support anybody who is willing to find the root of the problem.

>Btw. when is PureC 2 due? ;-)

PureC died basiacally because nobody at Borland knows anything about it. Since there is somebody (I am not going to tell names here) who will sue Borland for licenses if we continue selling PureC it is not going to happen. But that's a whole different subject.

Source record: 117325

We got our first (first of three) ST in 1987 and the first computer game I purchased was Dungeon Master. That game has great graphics and great gameplay and came on one single-sided 3-1/2" disk. When it was ported over to the PC it occupied more disk space than that (I don't remember exactly how many double-sided disks it took). Years later, I purchased Dungeon Master II for the PC and it came on a CD, undoubtedly with enough info to fill many single sided disks and the graphics, IMO, aren't any better than the original that I saw back in 1987.

Toy? Best toy I have. I have my PC, sure. I've had that since 1991. But in my family room is my ST. This is one toy I will never get rid of.

Too bad Atari didn't realize what they had....

For Sale

Atari TT030 computer, 4MB, 1GB harddrive, new lithium battery, excellent condition

350 UKP

21" Eizo FST multisync greyscale monitor (works on TT high - absolutely gorgeous!)

400 UKP

Notator Logic, all manuals and dongle, log3 interface

200 UKP

Or entire system (TT, 21" monitor and LogiC) for 750 UKP!

If interested, email Simon on WilliamsSG@cf.ac.uk, or svp@compuserve.com

3072. MiNT help for ST young'un?

Newsgroup: comp.sys.atari.st
Date: 1997-09-09 00:00:00 UTC
From: williams@mustang.ecsel.psu.edu
Message-ID: <5v49ev$1hrk@r02n01.cac.psu.edu>
Source record: 117328

Hi. I've recently acquired a 1040ST(F I think), with most of the kit and kaboodle. I've been trying to Install MiNT (the distrib pack...disk1.zoo to disk9.zoo) and have been having some problems. For starters, I've been consistantly getting TOS Error #34, which I know to be an invalid path error. When I get this, I generally have to figure out where it wanted to write, then make said directories *for* it.
Anyway, if someone out there could give me a brief walkthrough of what I need to do before running MiNT, ie what drives should be configured, how many partitions my 42M HD should have (it's empty, and currently has just one partition). I can get as far as running INSTALL.PRG, and that is where everything starts going funny. I can load INSTALL.SYS from disk one, highlight the 29 files, then when I hit (install config? whatever button that escapes me now) I get an invalid path.

Please help me! I've absolutely fallen in love with the ST series.
I went from playing with a friend's ST to owning my own complete system in about a week and a half.

Many thanks,

Ken Williams
williams@ecsel.psu.edu

PS anyone know where to get TOS upgrades in Pennsylvania?
...okay, how about an up-to-date mail order catalog for hardware?

So what address can I write to then? I never get any response when I write to the addresses on your homepage. The last mails I sent you was about CAB 2.5 (I want to upgrade from 2.0, if possible without having to pay for PPP-Connect which I can't (no clients)/won't (MiNTnet is free) use anyway) but I never got any answer.

> more developer to fix problems like these because the market simply doesn't
> pay for it.

Those that will stick with their Ataris in the future will almost certainly accelerate/upgrade them, and I guess that in the future Falcon-owners will be in majority. They have the most modern Atari-computers, has bought them fairly recently (compared to ST- and TT-owners) and probably paid quite a lot for them. So getting MagiC to work properly on Falcons should be very important!

> Sorry, but I don't know any standard problem that occurs on a clean Falcon.

It freezes randomly, irrecoverable crashes (System stapfel uber-something) and trashed partitions. Not even on a 100% standard Falcon with only MagiC and HD-Driver running was it possible to use it for more than an hour. On some Falcons it works fine, other not at all. A demo-version would have been nice, so people can test it before they buy it and avoid the frustrations of an extremely unstable OS. There are demos of MagiCMac and MagiCPC, so why not MagiC?

> My information is that all the problems that have occured are fixed (either
> by MagiC bug fixes or fixes in the drivers used).

The latest version I tried was 5.03, but it wasn't much better than
earlier versions. I understand that the current version is 5.11 or
something.

> >Btw. when is PureC 2 due? ;-)

This is a pity. Pure C is very fine indeed, but needs some improvements
(Optimiser, libs, slightly outdated GEM-interface.) to be perfect.

Jo Even Skarstein

>updated it woould explain things.

Nope, at work we're connected to JANet, I'm on Demon here. However if
Zetnet is showing the same problem it's looking more like a problem
with CAB etc than name servers. I do remember that when I first had
trouble I tried the main uni-karlsruhe pages and they mentioned
something about reconfiguring their servers and it affecting which
address you saw them as - sounds like some kind of redirection or
aliasing, which might be the cause of the problem.

> I used to be able to
>>access it OK a few weeks ago from home, so I'm getting suspicious
>>about the OVL.
>
>Ah, you replaced it recently? I'll have to try and find an old OVL and
>give it a go.

Tried it late last night: reverted to OVL 1.25 and STiK 1.12 with no
luck. My hunch now is that uni-karlsruhe is doing something which
Netscape/winsock understands and CAB/STinG doesn't :-(

Drat.

Source record: 117155

Hello. I have an affordable VME video card for sale. it works in
the Mega STe. I have been using it for months and it works great for me.
It slows down the system, but not very much. It provides one resolution
of 1024x768 at 16 colors. I am asking $75 plus shipping. Nothing is
wrong with it, but I am getting a card with a better resolution/colors.
I will not lie, it is picky about what monitor it is on, but if you
send email, describe what monitor you have and year it was made.
Also tell me whether the video cable on back of the monitor is permanant
connected or removable (socket). This will help in determining if the
card will work for you. When it works, it works well and has nothing
strange about it. It doesn't work in MagiC because a driver is not made as
of this point. I have a selection of drivers which I had to find myself
when I bought the card. I will include them. Pretty much it will be
ready to go. An excellent card for someone on a budget (perhaps someone
who bought one of those Toad $60 motherboards like me) :)
Bye!

->
->-Jared
->.
Jared, I have a quantum drive that does almost the same thing. Sadly, if your
falcon boots and it worked with the drive before, then it is most likely
your drive. Falcon IDE drives are expensive too :((

3079. Fuji "TV sighting"

Newsgroup: comp.sys.atari.st
Date: 1997-09-10 00:00:00 UTC
From: 404on040@remove2reply.iwvisp.com
Message-ID: <5v4v7i$471@news.iwvisp.com>
Source record: 117157

While watching Videodrone on the SF channel, I spotted the Fuji:).
In the sceen where Max kisses the TV, atop the set you will notice
a few games which are Atari cart boxes. You can definetly make out
the Fuji, and almost see all the Atari name on the box. There is also some
hardware on top, but I didn't cache the sceen until it was almost to late
to tell if the 2600(?) was there too.

3083. PH Player (sample player) - New release

Newsgroup: comp.sys.atari.st
Date: 1997-09-10 00:00:00 UTC
From: wongck@letterbox.com
Message-ID: <5v4tum$mr9@usenet.pa.dec.com>
Source record: 117161

Probe House (PH) Player release 4 is now ready for downloading from

http://www.geocities.com/SiliconValley/6880/phsw.html

New in this release:
* New non-modal GUI
* VA-protocal support
* MS ADPCM support

PH Player is a DMA sample player for the STE, MSTE, Falcon & TT range.

Main features of PH Player are
* Famous format supported (wav, au, voc, snd, avr, aiff, iff).
* Auto sample speed adjustment.
* Multi tasking aware.

But most important ..... PH Player is FREEWARE
... no conscience of not paying up for shareware, not crippled & no nagging!

Regards
William

AFAIR this is not the fact. When the first demo of Script came out, it had
a german tos/desktop on the disk, and you had to boot with this disk to make
Script run on a non german computer.

How they did it, I don't know.

cheers

It shouldn't crash because of lack of memory.MS-DOS programmes must ask the OS
to use memory.It's up to MS-DOS to tell it where the free memory is.
Actually,this is how the Atari works too.

And if the requested amount of memory is not available then the OS will say so.
And of course every programmer always
- checks the result of every system call
- writes appropriate code to deal with the case that the system call failed
- actually tests all of these special cases to see that nothing bad happens.

And I have a claim on some Martian real estate that you really should buy.

And this is probably one of the most confusing things about the Sting package and the Sting documentation. This option, running Sting through a network to another machine via a physical cable, is something very special that most users won't need (nor understand). Nevertheless it is emphasized in the documentation. There is no avoiding reading about it and getting all mixed up. These things should be "hidden" from the ordinary user, and put in some appendix for the tech heads. And the CPX for this should somehow put aside too. I spent a lot of time wondering about the details of this, as it says in the docs that I should read it, before I understood that all of it was completely irrelevant for me.

(Reposted, because I put it into the wrong place :-(

Hello all,

I've been ignoring my Falcon for a few years now, but I'd like to put it
all back together so I can use it to program my Jaguar :-))

I've sort of got used to my SGI now, so what I thought I'd do would be
to link the two machines together with MiNT-net (or Fenix, when it
becomes available) so that I can program in the relative comfort of
Irix, and download onto the Jaguar from the Falcon.

I've set up a serial line between the two machines, and with terminal
software, I can log into the SG from the Falcon at 38400 baud, using
Connect. So far, so good. I've also set up SLIP on the SGI in the
standard way, so that you log in as 'slip', give a password, and the
SGI says 'starting SLIP' then you have a SLIP connection active. What
I don't seem to be able to do is get the SLIP connection to work when
inside MiNT.

I've tried the slattach stuff, but figured out I needed dip. I
configured dip, and it just hangs. I'm using the device /dev/modem2,
which at least responds with garbage when I use minicom to talk to
the SGI.

(garbage: it returns a few random characters after I press return - I
assume this is the 'login:' prompt from the SGI, after it's been munged
somehow)

So, I think I'm using the correct device, I think I have the correct
software (dip), and I think the line works ok. The only thing I can
think of is that the MiNT drivers can't handle 38400 baud.

I seem to remember that ST's (Falcons too ?) couldn't drive the serial
hardware at high baud rates... Is this my problem ? And if so, how do
people use modern modems ? Certainly Connect has no problems, or is this
just clever programming on Connect's part ?

I looked through the version of MiNT's tty.c, and it seems to indicate
the serial lines can go as high as 230kbaud (wow!), but maybe it needs a
.xdd driver...
```

Any help gratefully appreciated.

ATB,
Simon.

John,

Do not activate the "Active" box in the Port CPX - the one you want to activate is the one in the Sting Internals CPX. The one in the Port CPX is activated automatically by the Dialer when you dial. No wonder you have to disconnect before you can dial - just leave that one alone.

Because you have disconnected already, your failure to communicate (what we have here....) could be directly attributable to the "Second Login Bug" that is seemingly endemic to this version of STING.

On the other hand, maybe not...

>printer font!

Actually you can print out documents from Everest in outline fonts!

In the Print parameters box you will see two radio buttons, one for GEMDOS and one for GDOS. Click the button for GDOS and then below it will appear a selection box allowing you to choose the font and size of any NVDI/Speedo installed typefaces. You can also change the margin measurements etc.

This feature has been included in the last two versions of Everest I have had. But probably isn't in earlier ones.

>If you want to be able to see multiple fonts in a single
>document, and print them up that way, and use all those outline fonts
>youhave, you'll have to use something like Atari Works, or Papyrus.

Yep, that's the only real way. Everest will simply print out the entire document in the selected font at the selected size. And if it is a proportional font, things can get messy.

Apart from some minor niggles and the shocking lack of a word counter, Papyrus is just about the best document processor the Atari has ever had. I use it for WP and reasonably advanced DTP and it's pretty good.

Kind regards
Mike Kerslake

This is a beta of Atari's TOS 5. The AES-part is slightly related to N.AES,
but N.AES is a commercial product and is much, much better than anything Atari
ever made.

> like fancy windows. What am I missing here? Does it need Mint to really
> be effective?

The AES-part of TOS 4.92 is available separate (KEMD rev.2) and needs MiNT to work.

> How does it compare to MagiC??

N.AES is more versatile, cheaper and more stable than MagiC (Atleast on my Falcon). It's not
quite as fast as MagiC (but almost), so if you have a lesser machine (ST) and don't need MiNT I'd
recommend MagiC (or Geneva, depending on your TOS-version).

Subject was: NEC DRAMS UK.....

I have a 1040STFM with a Power Computing "4meg" Upgrade Board.

The board contains 4 1meg 4bit NEC DRAMS ZIP (staggered pin) connection which gives 2meg.

I have four vacant slots on the board which would give me another 2meg.

My problem is that the NEC D424400V-70 DRAMS are obsolete.

Can anyone out there direct me to a source for these DRAMS or an equivalent?

Den R

A *complete* guess on my part ...

iirc, tos cannot access the last couple of clusters of a hard disk (or
floppy?). Perhaps this fixes it? If so, I'd be wary of enabling it
just for an extra 2k of space.

pg looks suspiciously like one of the possible format strings used
by msdos to specifiy how the command prompt looks! Perhaps magic's
command shell makes use of it in the same way, or maybe some other
shell uses it?

As for _PNAM, it most likely means "process name". I originally saw it
magically [ahem!] appear in my command shell's environment after
running it for the first time under magic. Once, whilst experimenting
with single/multitasking combinations with shel_write and Pexec() I
took the opportunity and made each process dump its environment. This

is what appears to be the case ...

Each process will find a _PNAM in its environment, which a getenv("_PNAM") or similar call should be able to retrieve, returning the full program name and extender (but not the path to it). My command shell for instance, being called "msh.prg" in one incarnation and "msh.tos" in another, finds PNAM set to MSH.PRG or MSH.TOS respectively. Processes spawned with shel_write find their own name placed in PNAM. Processes spawned with Pexec(0) find one of their parent's names in PNAM, having inherited their environment down the "spawn tree" from whichever parent was the last to have been spawned with shel_write.

... like I said, that is what appears to be the case *and* it was a while ago *and* I wasn't looking at PNAM per se. As to its actual functional purpose, who knows. I can think of several.

After several months my AixTT RAM board has finally arrived, amazingly.

However, I'm having some trouble getting it to work, and hopefully someone more experienced with this board or such devices in general can help me.

After receiving the board, I unpacked it from its static bag and connected it into the TT's TT RAM connector (in place of my old Atari 4MB SIPP board). I then put two 4MB 72pin SIMMs into the AixTT RAM board and switched on the TT.

When the memory test appeared, all the memory tested ok, but only 4MB of memory was listed, even though I had put in two 4MB SIMMs (total 8MB).

I tried both jumper settings, but this made no difference.

I then tried two 32MB SIMMs, but these showed somewhat different symptoms. The memory test went ok for the first half, but the second half came up all X's, indicating that the memory did not test ok. Also, the second half of the memory test bar appeared very quickly compared to the first half. Only 16MB of memory was listed at the end of the memory test, even though I had put in 64MB of memory (two 32MB SIMMs).

Now the situation is worse, however: after I tried those 32MB SIMMs, the board no longer works at all! No matter what SIMMs I put in, the memory test completely skips the TT RAM now, as though no TT RAM at all is installed. It would appear that, at that point, the AixTT RAM board must have got damaged.

I have since come to know that there are PS2 SIMMs, which are different to other SIMMs in that they consist of only one bank. It seems that the SIMMs I was using were not PS2 SIMMs.

While Aixit told me that any 72pin SIMMs would be suitable for the AixTT RAM board, I notice that the documentation supplied repeatedly refers to PS2 SIMMs, although since the documentation is in German I can't determine exactly what it says (since I don't understand the German language).

So: does the board really work with any 72 pin SIMM, or is it only PS2 SIMMs that are compatible with the board?

If the board only works with PS2 SIMMs, would the board have become damaged as a result of trying non-PS2 SIMMs?

What can I do now?

Of course I mailed Aixit about it, but if they are as hopelessly slow at responding and as unhelpful as they have been in the past, I think I might not get very far with this. So I hope some other user of the board is able to help me.

Any assistance with this problem would be much appreciated.

(Although I regularly read this newsgroup, I would appreciate it if replies could be sent by email as well as to c.s.a.s.t. since I sometimes miss replies otherwise. I will be sure to post a summary to the group once (if) I get the problem sorted out.)

hehehe, than what ?... theres a hell of a lot of threads in here that are ultra boring, so boring I pass them right on by, simply because I know the subject has nothing to do with any of my interests,
A test message (as in this particular case) can also act as an introduction of a new atarian to the world of usenet,

>I'm sure the sysop would add demon.test or something if peopel asked. I

I am sure he wouldnt, a sysop of a BBS offering fellow atarians access to newsgroups and not charging for the service as indeed most don't, well they have to pay for every single posting made and received, he wouldnt want to go to the added expense of a whole new newsgroup just for testing, how many tests do you see from BBS users, not many?

>normally just ignore them but when I saw that this one was numbered I
>thought it might be best if I recommended a more appropriate group.

Yes it did look like there was more to follow didnt it, so I can see where you coming from :)

As it turned out, Mario's board was simply not seated correctly
onto its socket. It now works perfectly and Mario is a happy camper!

For those who need English docs, I have scanned the translation
of the AixTT docs produced by Computer Direct as a 16-color GIF.
It will be uploaded to my page, as soon as Chris Krowchuck gives
me permission to copy their stuff.

Check my "TT030 Homepage" section regularly for updates about this.

I got a ZIP that I want to connect to my ST, and rather than mess around with the silly cable to provide TERM PWR, I would much rather drop in another drive to provide PWR and additional functionality for later use. So I am "in the market" for a low-cost CD-ROM drive. No need for this 8x or 24x or whatever is current in the peecee world. Anyone upgrade lately? Or know what surplus shops in the US might have this sort of thing?

This is good info.. but what's missing is availability, or did I miss it? Is it available now?

I will buy an 040 if it will run Cubase Audio Falcon and is reasonably priced.

>this the same as N.AES? It seemed to be pretty much useless, unless you

That's illegal :->

N.AES is a (N)ew (AES), have a look to MultiTOS. (Better as MultiTOS)

>How does it compare to MagiC??

N.AES is not the same as MagiC, but you can run your sofware under
N.AES or MagiC. MagiC is faster as N.AES
N.AES follows the MTOS line (compatible)

MagiC does the same, but on a different way.

I can't remember me for the name of a .hyp how was contains some
features of TOS, MTOS, N.AES and MagiC

In <11346435_000003_OASIS_NEWS@the-gap.demon.co.uk> Gary Priest wrote:

>Are there any Falcon users out there who have got STiNG working??????

Yes, but SLIP only..

If i use STinG/PPP i got a connect, not more
PING 127.0.0.1 looks OK
PING 195.37.9.10 also (That's my STATIC IP what i have to use with SLIP

As PPP accunt if have to acept dynamic ip adresses.
That do not work. That's the results after two weeks of try and error :/

(After activate STinG Port CPX -> Bombs, crashes after connect or a stuck machine)
Without serial CPX -> connect only with 19K2..

I quit that job last sunday.
I can't found ANY guy how was got PPP working successful with a falcon.

(I remember me my first steps with STiK, that's succesfull after 2 Days)
(And that was my first contact !!!!)

The company closed down last summer but has resuscitated as OXO Systems.
They have been quite silent for a while though, but I think they are
still working on WENsuite...

Here is their new email address : oxo@imaginet.fr

It's not there any longer as I've left, I'll try and put it up again at:

http://www.users.zetnet.co.uk/wyvern/

It should be there in a day or two - if it's not give me a yell. Sorry for
not replying earlier - been busy recently. It has a few GDOS drivers on it,
but I think they are all for FontGDOS - the much improved replacement for
GDOS (unfortunately I think it really wants a hard disk or say a 2-4MB Atari
for a large ramdisk).

3124. Calamus users website

Newsgroup: comp.sys.atari.st
Date: 1997-09-10 00:00:00 UTC
From: "Mayfair Music Publications Inc." <maymus@istar.ca>
Message-ID: <3417242B.7C50@istar.ca>
Source record: 117202

Hello good people,

I'm a user and big fan of CALAMUS and I have not found much info around (in English) about it on the web. Am I completely wrong about this?

Anyway, I'm thinking of setting up a non-profit web site with the purposes of:
(1) providing information, an FAQ, tips etc. collected from users and MGI (the company which presently develops and markets Calamus)
(2) spreading the word about what is without doubt the vastly superior DTP tool around today (with the hope that it will eventually become more widely used in the publishing industry and give Calamus users a job or too)

I'm not the grand poopah of Calamus but I've used it in a professional setting for over a year. I'd really like to see some source of user information and help around (and not just for the Atari!)

Any feedback, comments, suggestions and even insults will be happily received.

Bill

I decoded it with Newsie, and here's what it said:

CENTEK - AUGUST 1997

****
* PHENIX 040® / PHENIX 060® *
****

>>> PRELIMINARY FEATURES V.0.9.7 <<<
(040 prototype phase)

THE 040 AND 060 VERSIONS ARE NOW DIFFERENT :
see the end of this file about the PHENIX 060

****
* PHENIX 040® *
****

- MOTOROLA MC68040V® at 33 MHz (BCLK).
NOTE : The 040 instructions are clocked by the BCLK
and NOT PCLK (66 MHz) - See chapter 10.2 of the DATABOOK !
By example : - Afterburner® is a 040 at 32 MHz !
- Hades® 040 is a 040 at 32 MHz !
People who present the 040 as a 66 MHz clocked
processor are liars !!!
CENTEK refuses to use the same commercial politic !

- BUS : 32-Bit DATA / 32-Bit ADDRESS / 33 MHz Frequency.

- 512 KB of R-Memory® cache to boost the softwares.
This 15 nS memory area allows 2.1.1.1 CPU BURST (105 MB/S
at 33 MHz). The R-Memory® is a CENTEK NEW concept and is
confidential at this time. Only Registered Developers
will be aware of it !

- Four DIMM sockets : 64-Bit interleaved RAM up to 256 MB.

- MOTOROLA DSP 56301® at 66 MHz (66 MIPS !).
- 24-Bit HOST port with 3 clocks cycles:
44 MB/S DMA transfert (or 16 MWords (DSP 24-Bit words).

- On-Chip Memories: - 2048 * 24-Bit X Data RAM.
- 2048 * 24-Bit Y Data RAM.
- 3072 * 24-Bit Program RAM.
- 1024 * 24-Bit Instruction Cache.
- 192 * 24-Bit Bootstrap ROM.

- Off-Chip Memories : 128 KB * 24-Bit 15nS SRAM (or 128 KWords).
- SIMM socket to add 4 MB DRAM (option for particular softwares).
- Enhanced external Falcon DSP connector.

- MOTOROLA MC68360 - QUICC&#65533; at 33 MHz.
(QUICC&#65533; : QUad Integrated Communications Controller).
- 4.5 MIPS at 25 MHz (CPU 32).
- 32-Bit DATA and ADDRESS lines.
- Four General-Purpose 16-Bit Timers.
- Two Independent DMA (IDMA) with Single Address Mode
(up to 66 MB/S at 33 MHz per DMA).
- Communications RISC Processor (22 MIPS).
- Four SCC
- Ethernet/IEEE 802.3 Optional on SCC1 (Full 10-Mbps Support)
A motherboard slot is dedicated for this option.
- HDLC/SDLC (All Four Channels Supported at 4 Mbps)
- Apple Talk&#65533;
- Universal Asynchronous Receiver Transmitter (UART)
- Synchronous UART
- Two SMC (Serial Manager Controllers)
- One SPI (Serial Peripheral Interface)
- Parallel Interface Port (Full CENTRONICS&#65533; compliant !)

- 64 KB FLASH Eprom containing the BIOS (SET UP/AUTOTEST/BOOT).
The FLASH enables the software updates.

- ULTRA-SCSI bus (SCSI Controller with 16-Bit DMA).
- The SCSI bus maximum rate is 20 MB/s.
- The HOST DMA maximum rate is 33 MB/s.

- VIDEO : MATROX MYSTIQUE&#65533; (up to 1280 * 1024 * 24-Bit).

- SOUND : The customer can choose a card between :
- Stereo INPUT/OUTPUT 16-Bit CODEC
with two MIDI INPUTS/OUTPUT (& thru) channels.
PC like connector (D-SUB 15).
* Another card may be added to get two STEREO
INPUTs/OUTPUTs and four MIDI sets.

- Professional 24-Bit External Card including
8 INPUTs / 16 OUTPUTs, four MIDI IN / four MIDI OUT
(& thru), SPDIF&#65533;/AES&#65533;/EBU&#65533; Interface.
* Another card may be added to get 16 INPUTS and
32 OUTPUTS (24-Bit).

- VOCAL : Interactive Neuronal Speech Controller for the
Speech Recognition, Speech & Music Synthesis,
Access Control, and Software ONLINE HELP !

- TIME : NVRAM (Non Volatile Ram)
with RESUME mode to Wake up the PHENIX®.

- SLOTS : Three DIRECT 040/060 Processor Slots for Hardware
Expansions such as :
- Video acquisition.
- Second (DSP 56301 + ULTRA SCSI) card.
- VME® bus.
- PCI® bus.
- Memory adding card (up to 256 other MB).

- KEYBOARD/MOUSE : ADB® Keyboard, mouse and joystick.
(ADB= Apple® Desktop Bus).
These keyboards include the POWER key !

- CASE : Standard BLACK Mini Tower.
This point may vary : we ordered a study of a new
plastic/metal desktop case...

If wished, the Mother Board will be alone available !!!

- OPERATING SYSTEM : DOLMEN® - 100 % 040 ASM code !

****
* PHENIX 060® *
****

The 060 version of the PHENIX includes all the features of the
040 version except about the following points :

- MC68060 at 80 MHz (over 120 MIPS !)
- BUS is 3.3V and is clocked at 40 MHz (the 060 bus controler is
configured at 1/2 the CPU clock ! (cf the HADES® 060 is a 060
at 60 MHz and a bus at 30 MHz ! Official question : what's about
the 120 MHz of the 060 ??!!)
- DSP 56301 at 80 MHz (80 MIPS).
- ULTRA WIDE SCSI (16 bit) with 16-bit DMA :
- The SCSI bus maximum rate is 40 MB/S.
- The HOST DMA maximum rate is 40 MB/S.
- Up to 15 devices on the SCSI chain.

- L2 cache : this point is not fixed.

****
* MARKET INFORMATIONS *
****

-> The 040 complete BASIC configuration includes :
- 16 MB DIMM (64 Bits).
- One 16-Bit Audio card.

- 1.2 Go ULTRA SCSI Hard Drive.
- 12x SCSI CD-ROM Drive.
No monitor included.

-> The price : 1.400 < < 1.800 U$ Dollars.

-> Very low prices for the Hardware and Software Developers !!

-> CD-ROM (AND PAPER) complete Documentation (Software and Hardware
(slots and DSP connector) and SYSTEM HOTLINE (Phone/E-mail/BBS)
for the developers !

****

> takeover, thus changing it's name/URL again, and since I'm tired of having
> to announce new URLs all the time I've been looking for a permanent
> location of my Atari pages).

Have a look at www.netforward.com - they offer http forwarding - the idea is
that you give everyone one URL - http://www.poboxes.com/adrian.bridgett
and this forwards them onto your proper site
(http://www.users.zetnet.co.uk/wyvern).

Now I've just got to check that I've got mine set up :)

PS: I agree with everyone else Re: Geocities is fine, old site could be
slow.

I could read the message fine in tin (Linux) in case people couldn't read
it, try this:

CENTEK - AUGUST 1997

****
* PHENIX 040® / PHENIX 060® *
****

>>> PRELIMINARY FEATURES V.0.9.7 <<<
(040 prototype phase)

THE 040 AND 060 VERSIONS ARE NOW DIFFERENT :
see the end of this file about the PHENIX 060

****
* PHENIX 040® *
****

- MOTOROLA MC68040V® at 33 MHz (BCLK).
NOTE : The 040 instructions are clocked by the BCLK
and NOT PCLK (66 MHz) - See chapter 10.2 of the DATABOOK !
By example : - Afterburner® is a 040 at 32 MHz !
- Hades® 040 is a 040 at 32 MHz !
People who present the 040 as a 66 MHz clocked
processor are liars !!!
CENTEK refuses to use the same commercial politic !

- BUS : 32-Bit DATA / 32-Bit ADDRESS / 33 MHz Frequency.

- 512 KB of R-Memory® cache to boost the softwares.
This 15 nS memory area allows 2.1.1.1 CPU BURST (105 MB/S
at 33 MHz). The R-Memory® is a CENTEK NEW concept and is
confidential at this time. Only Registered Developers
will be aware of it !

- Four DIMM sockets : 64-Bit interleaved RAM up to 256 MB.

- MOTOROLA DSP 56301® at 66 MHz (66 MIPS !).
- 24-Bit HOST port with 3 clocks cycles:
44 MB/S DMA transfert (or 16 MWords (DSP 24-Bit words).
- On-Chip Memories: - 2048 * 24-Bit X Data RAM.
- 2048 * 24-Bit Y Data RAM.
- 3072 * 24-Bit Program RAM.
- 1024 * 24-Bit Instruction Cache.
- 192 * 24-Bit Bootstrap ROM.

- Off-Chip Memories : 128 KB * 24-Bit 15nS SRAM (or 128 KWords).
- SIMM socket to add 4 MB DRAM (option for particular softwares).
- Enhanced external Falcon DSP connector.

- MOTOROLA MC68360 - QUICC® at 33 MHz.
(QUICC® : QUad Integrated Communications Controller).
- 4.5 MIPS at 25 MHz (CPU 32).
- 32-Bit DATA and ADDRESS lines.
- Four General-Purpose 16-Bit Timers.
- Two Independent DMA (IDMA) with Single Address Mode
(up to 66 MB/S at 33 MHz per DMA).
- Communications RISC Processor (22 MIPS).
- Four SCC
- Ethernet/IEEE 802.3 Optional on SCC1 (Full 10-Mbps Support)
A motherboard slot is dedicated for this option.
- HDLC/SDLC (All Four Channels Supported at 4 Mbps)
- Apple Talk®
- Universal Asynchronous Receiver Transmitter (UART)
- Synchronous UART
- Two SMC (Serial Manager Controllers)
- One SPI (Serial Peripheral Interface)
- Parallel Interface Port (Full CENTRONICS® compliant !)

- 64 KB FLASH Eprom containing the BIOS (SET UP/AUTOTEST/BOOT).
The FLASH enables the software updates.

- ULTRA-SCSI bus (SCSI Controller with 16-Bit DMA).
- The SCSI bus maximum rate is 20 MB/s.
- The HOST DMA maximum rate is 33 MB/s.

- VIDEO : MATROX MYSTIQUE® (up to 1280 * 1024 * 24-Bit).

- SOUND : The customer can choose a card between :
- Stereo INPUT/OUTPUT 16-Bit CODEC
with two MIDI INPUTS/OUTPUT (& thru) channels.
PC like connector (D-SUB 15).
* Another card may be added to get two STEREO
INPUTs/OUTPUTs and four MIDI sets.

- Professional 24-Bit External Card including
8 INPUTs / 16 OUTPUTs, four MIDI IN / four MIDI OUT
(& thru), SPDIF®/AES®/EBU® Interface.
* Another card may be added to get 16 INPUTS and
32 OUTPUTS (24-Bit).

- VOCAL : Interactive Neuronal Speech Controller for the
Speech Recognition, Speech & Music Synthesis,
Access Control, and Software ONLINE HELP !

- TIME : NVRAM (Non Volatile Ram)
with RESUME mode to Wake up the PHENIX®.

- SLOTS : Three DIRECT 040/060 Processor Slots for Hardware
Expansions such as :
- Video acquisition.
- Second (DSP 56301 + ULTRA SCSI) card.
- VME® bus.
- PCI® bus.
- Memory adding card (up to 256 other MB).

- KEYBOARD/MOUSE : ADB®
Keyboard, mouse and joystick.
(ADB= Apple® Desktop Bus).
These keyboards include the POWER key !

- CASE : Standard BLACK Mini Tower.
This point may vary : we ordered a study of a new
plastic/metal desktop case...

If wished, the Mother Board will be alone available !!!

- OPERATING SYSTEM : DOLMEN® - 100 % 040 ASM code !

****
* PHENIX 060® *
****

The 060 version of the PHENIX includes all the features of the
040 version except about the following points :

- MC68060 at 80 MHz (over 120 MIPS !)
- BUS is 3.3V and is clocked at 40 MHz (the 060 bus controler is
configured at 1/2 the CPU clock ! (cf the HADES® 060 is a 060
at 60 MHz and a bus at 30 MHz ! Official question : what's about
the 120 MHz of the 060 ??!!)
- DSP 56301 at 80 MHz (80 MIPS).
- ULTRA WIDE SCSI (16 bit) with 16-bit DMA :
- The SCSI bus maximum rate is 40 MB/S.
- The HOST DMA maximum rate is 40 MB/S.
- Up to 15 devices on the SCSI chain.

- L2 cache : this point is not fixed.

****
* MARKET INFORMATIONS *
****

-> The 040 complete BASIC configuration includes :
- 16 MB DIMM (64 Bits).

- One 16-Bit Audio card.
- 1.2 Go ULTRA SCSI Hard Drive.
- 12x SCSI CD-ROM Drive.
No monitor included.

-> The price : 1.400 < < 1.800 U$ Dollars.

-> Very low prices for the Hardware and Software Developers !!

-> CD-ROM (AND PAPER) complete Documentation (Software and Hardware
(slots and DSP connector) and SYSTEM HOTLINE (Phone/E-mail/BBS)
for the developers !

****
You'd like to become a PHENIX DEVELOPER ?
You need a CONFIDENTIAL agreement !

gary@the-gap.demon.co.uk (Gary Priest) wrote:-

>Are there any Falcon users out there who have got STiNG working??????

Yep, got it working just fine here, and with all my usual AUTO progs,
etc installed.

The tips from the mailing list helped me out, basically I reinstalled
from scratch, killed the .PRT file and turned the active box off in
the PORT (I think) cpx.

I used the dial and settings scripts (I think I sent to you) and it
works, slowly, but it does work.

>that all of it was completely irrelevant for me.

Agreed, as 9% of most users won't be using it.

I must admit though as I do have two machines which are linked for
NeST (fidonet) message transfer using Semper, so it would be
interesting for me to try installing the STing link to see what
happens.

I've got a few concerns though before I start thinking that way:

- As installed at the moment I'm using the MIDI HsModem driover in the
auto folder and this works with Semper to send 31250 blocks of data.
It would be paramount that this ability is not lost.

- What use would the link be? To me I'd like to be able to transfer
files between machines using the MIDI link, would this be possible?

- If file transfer would be possible I assume it would have to work
via FTP, and that it would not be possible to have 'remote' drive
icons on the desktop?

- Would the NeST mail server still be able to process NeST (fidonet
mail via Semper) using the RS232 port while I was on the Falcon doing
a MIDI transfer of a file?

If you or anyone (Peter) knows the answers to the above it would be
most useful. Or of course if anyone has already set up that sort of
config (while not screwing up a standard STing dial-up connection
link) I'd be interested in the config files.

Involves stripping down to motherboard, connecting power supply to a
capacitor, fitting PCB over CPU, connecting signal leads, and fitting drive
to back of case near SIMMS. All this from manual - I didn't do the job, but
I saw the end of the installation - it all fits very neatly inside the case.

AHDI 6.06 supplied with drive.

No problems except a high pitched sound just at the upper limit of my aging
hearing - apparently switches off after about 30 minutes of not being
accessed.

John.

You can find the addresses to the different persons on the web pages if
you
look.

> about CAB 2.5 (I want to upgrade from 2.0, if possible without having to
> pay for PPP-Connect which I can't (no clients)/won't (MiNTnet is free) use
> anyway) but I never got any answer.

I don't see why no one wants to use PPP-Connect. Because there are no
clients?
Because it works? As PPP-Connect will be released in english very soon
and with
programming docs I bet that you will have as many clients as STiK if not
more within
a week or two. But if no one buys it (it's also bundelds with CAB which
is
at the same price as it was before PPP-Connect come with it) no clients
will be
done. Why? Sometimes I think that Atari people doesn't want new working
comercial
products (that doesn't cost very much either) but insteed wants free
buggy (usually
great as well though so I don't want to complain about them to much)
software
which produce 100000 mails about that they doesn't work. Why not try
something
new and give the few companies still supporting TOS your support?

> > My information is that all the problems that have occured are fixed (either

> The latest version I tried was 5.03, but it wasn't much better than
> earlier versions. I understand that the current version is 5.11 or
> something.

I have heard that 5.13 of MagiC is supposed to be _much_ more stable on
a Falcon
than previous version. The upgrade is free (I belive) so why not test
it? Not that
I have had any problems with erlier versions.

For Sale

Atari TT030 computer, 4MB, 1GB harddrive, new lithium battery, excellent condition

350 UKP

21" Eizo FST multisync greyscale monitor (works on TT high - absolutely gorgeous!)

400 UKP

Notator Logic, all manuals and dongle, log3 interface

200 UKP

Or entire system (TT, 21" monitor and LogiC) for 750 UKP!

If interested, email Simon on WilliamsSG@cf.ac.uk, or svp@compuserve.com

I am using 115200 baud on serial port on the TT with fast downloads,
To get more speed out of STing dont make the MTU larger than 1500 and
the MSS = -40 and set the time outs in the sting internals cpx to at
least 350 this makes everything tripple in speed and the timeouts
almost disappear.

Message-ID: <5v8lcm$lg9$1@brain.npiec.on.ca>
Source record: 117088

I have been using PageStream 2.2 for so long now, I almost forgot what it evolved from. A neighbour of mine is using Publishing Partner 1.03 and would like some extra fonts. I have some PD fonts for PageStream, but as far as I know there is no way to convert them for use with Publishing Partner. I have searched all my CD-ROM's and ShareWare.com and Filez, and cannot seem to find any PD fonts for Publishing Partner. If someone out there knows where I can obtain what I am looking for, please send me an E-Mail message. My neighbour is a student on a very limited budget, and cannot afford to purchase PageStream 2.2 SE right now.

In a message dated 05.09.1997 7:33:30 Uhr, you wrote:

>Firstly, I hope Roy made it clear that we DID NOT write this!

It wasn't very clear but I have no problem with that anyway.

>But what did we forget? The timing is fine for all areas of the

>motherboard, and printing is possible with the bus at 25MHz under TOS.

I don't know. I did not blame you for forgetting something. I just gave a
summary of how it was in the past.

>Not really. It is not a case of who's first to develop any product. That

>would mean everyone has to conform to a standard that was laid down some

>time ago, and which is probably no longer relevant.

True, but I guess MagiC is still kind of relevant.

>Replacing TOS also breaks the standard mode of operation, and all other

>OS'es seem to work correctly with a 25MHz Bus.

Probably we can see MagiC as being the standard mode or another standard mode
as well.

>MagiC works with

>Nemesis except for printing. MagiC doesn't work with Hades at all (?)

Meanwhile it does.
```

>As the problem will be much, much, easier to fix yourselves, we are quite

>happy to send you a Nemesis accelerator. As you probably know we have tried

>to fix the problem already, but didn't succeed. This is not possible unless

>you give us specific information about your printer routines.

Hey, has anyone heard us? We are both throwing free stuff around. ;-)
Sorry. Well I guess we need one if we try to fix the problem, but I don't want you to send stuff around unless I have the impression that the developers will seriously take a look at the problem. It doesn't get us anywhere if the board is just lying around. I already sent an e-mail to Wilfried Behne (from the MagiC team) to see what he is thinking about it. No reply yet...

>I don't think this is really relelvant. We know, for instance, that the

>Falcon's electronics are "dirty", which was one reason why it was much

>harder to implement Nemesis in the first place.

I guess we made the same experience here. ;-)

>We really would like to see this problem solved, but can't see this

>happeneing unless we are given all the relevant information.

Well the way I see it is, that the tricky part is to find out what the relevant information would be. On the other hand, when we know that, then we know what causes the problem and then the bug is probably already fixed.

We'll see what Wilfried says, but my guess is, that he will send me back to Andreas.

Hi

I want to upgrade my 2 Mbyte STE to 4 Mbyte, I also have a 520STFM with Frontier XtraRam deluxe but only 1mbyte RAM that I wouldn't mind putting 2 or 4 mbytes into. Does anyone know where I can get 1mbyte RAM boards for the STE in the UK? Ive been looking in local trade it papers but nothing like thast ever comes up, and I can't seem to find any Atari mage at the newsagents anymore. Can I use standard PC SIMMS, if so what spec? The PC shops I've tried have been less than useless.

If you can please email any response, thanks.

Currently I am using a 14.4 modem with my Falcon/Cab/Stik setup.
Is anyone surfing with a Falcon at 28.8? 33? 56? Please let me know
your experiences and what the fastest modem I should get for my
setup. Does the brand of modem make a difference with Cab?
Is there any way to test the throughput of the modem with Cab other
than to watch how fast the bytes come down the line? (holy
inaccurate methods batman!) I have read in a PeeCee modem forum of
many users of 56K modems trying to connect with 56K servers and
maxing out at 33K!

Thanks in advance for any info.

Jared.

Try to boot with your HD-driver (AHDI, or any other) on the floppy
and then access the HD. Maybe the driver is somehow corrupt and you need
to reinstall it.

Regards.

Daniel.

If you have an external drive then boot up with it switched off and a blank disk in A:. when you get to the desktop with just the Drive A: and B: icons then insert a disk with the ICD utils. This contains a program called ICDBOOT.PRG which will start the hard drive. Switch on the hard drive and run the program. You can then install a C: icon from the 'install disk drive' option under the options drop down menu.

Most hard drives, when booting allow the user to not boot from C:, but to just initialise the hard drive. Try pressing A diring boot up and see if that works, failing that hold down different combinations of the contol, alt and shift keys. One of them usually prevents programs and accessories from been loaded from the hard drive.

Yes, it looks like that was probably the source of this particular problem. Thanks. It wasn't clear in the docs that this bit doesn't apply if you're using the Dialer. Whether it has any effect on the other problems, I'll find out the next time I try it.

What do you need to do? If you only need to transfer the occasional file I guess a simple terminal would do. For more advanced networking (shared disks etc.) MiNTnet would be a good solution. There are NFS-drivers available for MiNTnet, and you have the benefit of being able to telnet between the machines, running ftp-sessions etc.

No, not at all. Just rename it AES-41.PRG (or anything.PRG) and put
it as last in the AUTO folder, it will run under plain TOS.

Bye! Bruno.

I'm using a k56flex modem with my Falcon030 and it works just fine. The speed depends on the quality of the lines. Don't expect to get a 56k connection as it's next to impossible, something between 44k and 52k is what you can expect. I usually get connected at 50kpbs but after a while it tends to drop to 46kbps. Sometimes I get connected at 54k, but not very often unfortunately. However, a 46k connection is much more fun than a 33.6k one. 8-)

All the best,
Daniel

Source record: 117106

THE ATARI TIMES

What is the Atari Times?

The Atari Times is one of the leading English language Atari disk magazines. It is different to most in that it can be read on any computer system - as long as it has a HTML viewer or web browser.

We chose HTML as the format as we felt it offered the best way to create articles which utilised both text and pictures.

To date, we have released 10 issues of the Atari Times. We have had contributions from many well known Atari users including Frank Charlton, Harry Sideras, Joe Connor, Colin Fisher-McAllum, Kev Beardsworth, Richard Spowart, Roy Goring, Ashley Seabrook and Matthias Jaap.

We have readers and contributors all over the world, from America to Australia.

Each issue is packed with articles ranging from reviews, news and previews to features which can only be found in the Atari Times. One of our most popular sections is the User Profile which, each issue, contains a profile of a famous Atarian. We also have a few on-going series such as HTML made EZ.

Why do we do it?

Back when the first issue of the Atari Times was released, there was quite a large feeling of uncertainty in the Atari scene. One of the biggest Atari companies, and publisher of the excellent Atari World, Compo Software, went into liquidation. The other big Atari magazine ST Format also looked very weak.

It wasn't all bad however, also around the same time quite a few new user groups were being formed. Not all of these survived but those that did have gone from strength to strength. We felt that the Atari market had more than enough in it to keep a magazine like the Atari Times afloat - and there was a need for such a publication!

In fact, after the disasterous first few months of 1996 the people in the Atari market suddenly realised that unless something was done quickly things could get a lot worse! Long time Atari supporters decided that they'd come together to stablise the market.

May was easily the first good month of the year!

As time has progressed, the Atari Times has grown stronger. We're the first to admit that the first couple of issues were very poor - hardly anything in the way of good content. Luckily, we persevered and now we have a thriving magazine which is working alongside the market instead of in competition. Thanks must also go to Chris Goods favourable review in the first issue of Atari Computing - it made us realise that our work was being watched!

Many people have commented on the friendliness of the Atari community and the Atari Times is living proof of it. Without the support of our readers, the Atari Times would have died a very long time ago. But now, it looks as if we'll be around for a long time to come!

What more is there to come?

Each issue of the Atari Times carries the latest news and information in the Atari scene. Apart from that, we'll continue to bring you the best reviews, previews and features we can.

This means that we need your help.

If you would like to write some things for us then we will be more than happy to include them. So, if you've found a new program and would like to tell the world about it, write a review for us. If you have any news then please pass it on to us. If you want a regular section then contact us with your ideas and finally, don't forget to send us letters - tell us what you think of the magazine and what you'd like to see more of, how else are we going to fill our new letters section!

Advertising in the Atari Times

The Atari Times now offers what is one of the best ways to promote your organisation. Free advertising space!

As the magazine is in the HTML format adverts can contain both text and full colour pictures enabling you to create the most eye-catching and attractive designs possible.

Please contact Colin Polonowski via email at polonowski@zetnet.co.uk if you are interested in advertising in the Atari Times.

We have a limited amount of space for adverts and we reserve the right to refuse any advertisement for any reason.

Where can you get the Atari Times?

The Atari Times can be downloaded from any FAN connected BBS or can be ordered from Floppyshop in the UK.

The Atari Times Homepage on the WWW always carries the latest issue along with a few back issues. To find the Atari Times Homepage, point your browser at http://www.users.zetnet.co.uk/polonowski/

Copyright 1997 Croft Soft Software
Please spread this press release far and wide!

Hi David.

Look at the Chro-magic or Systems for tomorrow webpages, they have
inexpensives CD-ROM drivers (1x and 2x) and you can ask for a bundle price
with ExtenDos Pro and some Atari CDs.

Regards.

Daniel.

I have a very nice Atari 1040stfm and SM124 hi-res monitor. If you are interested I would like $ 135.00 includes shipping anywhere in USA. It includes the mouse, sevsral disks, cables etc. I even have the original box for the 1040STfm. I will also throw in a couple of STart magazines. e-mail me if interested.

Very nice and clean, here is your chance to get a complete system with softs included.

3167. English version of CAB 2.5?

Newsgroup: comp.sys.atari.st
Date: 1997-09-11 00:00:00 UTC
From: spunkie@primenet.com
Message-ID: <5v9u1k$q80@nntp02.primenet.com>
Source record: 117112

Does anyone know where I can get an English version of CAB 2.5, if it isn't out yet, any news when it will be. What is the best set up for it? I'm using CAB 2.0 and having trouble with it. I am a novice computer user and I love my Falcon. Anyone know how well 2.5 work. I'm using a Falcon030 with 4 megs and a hard drive. I have it very stripped down with only the bare essentials on it. Should I run a multitask application when using CAB? Help
thanks, lewis

3171. segmenting files on Atari ST

Newsgroup: comp.sys.atari.st
Date: 1997-09-11 00:00:00 UTC
From: bob.shuster@webphoria.com
Message-ID: <bob.shuster-ya02408000R1109972221050001@snews.zippo.com>
Source record: 117116

Is there some compression program that will allow one to segment files ("split" files) across several floppies? I know there are Mac and PC programs that will do this, but I need one for my Mega4. I have a bunch of files on my Mac that I'd like to transfer over, but they are too big to fit on an 800K floppy. I know I can hook up a null modem cable and transfer them that way, but my ideal solution is to use floppy disks.

Any help would be appreciated. - Bob Shuster

>inaccurate methods batman!) I have read in a PeeCee modem forum of
>many users of 56K modems trying to connect with 56K servers and
>maxing out at 33K!

Andrew, I'm using an US Robotics 33600 with my Falcon/Oasis v1.35e, and it
works beautifully. My ISP only supports 28800, but the Falcon/Sportster does
handle this just fine. You can only go as fast as your lowest common
denominator. For example, you have 14400, so thats as fast as you can go,
I have 33600, but my ISP only goes to 28800, so 28800 is what I get. If
your have a 56k modem that is compatible with your ISPs version of 56k, then
you should be able to get that if your phone lines will handle it. There are
currently 2 56k standards, so make sure you match up with your ISP! :)

>which runs as an acc (V.85). The dialer version is the same as the one released
>with the latest STiNG, but the latter would not work with STiK ("do not use this
>dialer with STiK").

STiK 1.13 was a beta.. and wasn't really meant to be released
anywhere. There is a problem with it running under magic but unless
your running under magic and run more than one stik program at once
then you wont bump into this bug.
Which FTP site is this on Btw?

>I don't know if this was supposed to be posted there. Unless i'm dreaming, it
>sure is a hell of a lot faster than V1.12. I'm not talking about a little increase,
>but a major increase in transfer speed.

1.13 is quite a bit faster than 1.12 but because of the problem with
magic it was decided not to release it and to continue work on stik
2.0 instead.

>Maybe I haven't been keeping up with the latest versions. I checked the STiK page,
>and saw no information concerning it.

Thats because as I said.. it wasn't meant to be released..

>Now if I could get it to resolve FTP and IRC sites on this damn NT server i'd be
>happy. I have to enter the IP address to get anywhere.

Try using a nameserver from a different provider local to yours.. Or
for testing try 158.152.1.43 which is a demon nameserver but should
work anyway although being a bit slower than using a local one.

>By the by, I used my old stik.cfg file and the dial.scr from my failed attempts with
>STiNG without problem. Modem.cpx with none of the cpxs included from the STiNG package

The difference between 1.12 and 1.13 from the outside is that as you
mentioned it does not require a stik.acc to be loaded at all times
there is a version of Peters dialer which was written for this version
of stik before sting was completed and that is the one you have.
There was also a quick version of the original dialer that could be
ran as a program or an accessory.

Nick.

John,

If you want the TT version, Cybercube Research in Canada might still have some. I think falcon versions are hard to come by. Did you know the demo version is fully functional but limited to 320x200 resolution? You can use all of the features and save the results with as many colors as you want, just the size is small. I've got a number of commercial sites linked on my homepage if you want to take a look -- people.delphi.com/greg_evans -- US, Canadian and European companies. Maybe one of them will have a copy. A beta of version 2.0 was floating around a couple of years ago. That may be the version you want.

The switcher doesn't work with the Falcon Audio version. This is why it
didn't come with it. It was a part of former Cubase versions. Unfortunately
I don't have it anymore either.

>Hi Peter
>
>If you're planning on writing a telnet, then why bother with VT100? Go for
>VT220, that's what I'd really like to see on the Atari :-)
>
>Gary

May I ask why??? I looked into it when I did TelVT102! I found
Plenty of reasons for VT102 over Vt100, but not for 200. If you think a
THOROUGH description of VT102 is hard to find (and believe me, it is) VT200
is orders of magnitude worse.

Unless I am wrong, Peter isn't looking to write a new Telnet, since
he spent a good deal of time helping me get TelVT102 into shape. If you
REALLY think VT200 (or VT220) is needed, help ME find the specs with a thoro
description of the way each of the control codes works and I'll fix TelVT102!!
That would seem to make more sense, since the framework is already there.
Or don't you like TelVT102, and why???

The Phenix only exists on paper for the moment. It is in it's very early stages of development, so I wouldn't keep my hopes to high. Although I wish them the best of luck, I'm not sure it will be available before a few years (especially when you see the delays Centek has had just for launching the CenTurbo 2 board), and at that time it will probably be obsolete.

3185. *NEW* Atari ST Quick FAQ - v2.0

Newsgroup: comp.sys.atari.st
Date: 1997-09-11 00:00:00 UTC
From: bales@hol.fr
Message-ID: <19970911080822195887@ppp98.tou.hol.fr>
Source record: 117223

I think I've just about finished the updates to my Quick FAQ v2.0

I've added and changed quite a lot of stuff, but some details might be
wrong or missing.

I'd like to have your opinions, comments, suggestions, death
threats,etc... about it before I replace the old one.

The new one can be found at:

http://wwwperso.hol.fr/~nbales/quickfaq.htm

Thanks a lot for your support,

Nick

3187. STiK V1.13b

Newsgroup: comp.sys.atari.st
Date: 1997-09-11 00:00:00 UTC
From: 404on040@remove2reply.iwvisp.com
Message-ID: <5v870m$423@news.iwvisp.com>
Source record: 117225

I stumbled across a version of STiK I hadn't seen before on an FTP site. It's the modular version (or it was called that anyway) which loads in the auto folder and no STiK.ACC is used. There is a dialer from Peter (STiNG) which runs as an acc (V.85). The dialer version is the same as the one released with the latest STiNG, but the latter would not work with STiK ("do not use this dialer with STiK").

I don't know if this was supposed to be posted there. Unless i'm dreaming, it sure is a hell of a lot faster than V1.12. I'm not talking about a little increase, but a major increase in transfer speed.

Maybe I haven't been keeping up with the latest versions. I checked the STiK page, and saw no information concerning it.

Now if I could get it to resolve FTP and IRC sites on this damn NT server i'd be happy. I have to enter the IP address to get anywhere.

Another happy STiK/Slipp user,

Mike

By the by, I used my old stik.cfg file and the dial.scr from my failed attempts with STiNG without problem. Modem.cpx with none of the cpxs included from the STiNG package were used. I'm running MiNT 1.2.6 (040) and N.AES.

Nope.....testing is all done now.

I'm fixed into the comp.sys.atari.st newsgroup through All At Sea [one
of the U.K.'s finest BBS's] however, as there are a limited number of
newsgroups I've got access to I decided to use a more popular one for my
testing, as I say though, all done now, sorry for any hassle I may have
caused :)))

That's just what I asked TUS and Titan. TUS never replied. Titan told me
they were waiting for the same info from TUS.

sbarrett@indigo.ie did rant to All ... here's the result...

Hiya sbarrett@indigo.ie....

s> Organization: Indigo
s>
s> Is it possible to use a tos image from one Atari (v2.06) on another
s> Atari. I know that the early St's used a disk based tos and I was
s> wondering if it is possible to load the new tos vesion on top of the
s> old from disk. I have tried using an auto folder (some chance ;-))
s> without success. Any help will be greatly appreciated.

It is possible to load newer TOS images over the old ROMS, Magic and
Geneva do this however, if you mean specifically something like loading in
TOS 1.62 [on disk] over hardware TOS 1.00 then I guess you can....but
it'd be VERY unstable, TOS 1.62 was developed for the STe and allowed
access to the BLITTER chip via the manu bar....seeing as a TOS 1.00 STFM
doesn't have one I'd not like to see what happens :-|||

My advice is to obtain new hardware ROMS and replace the one's you have.

> know. thanx

If your wondering about parity or non-parity SIMM modules, neither!

The falcon uses special memory expansion boards. Third party
manufacturers make SIMM expansion boards though...

No, switching an external drive on or off when the Falcon is switched on
won't do any harm at all. When do you think external drives should be
switched on? Simultaneously with the Falcon? Some users say you mustn't
do that. Anyway, with either method I never had any problems in the past
10 years.

3196. Printing with Papyrus 5...HELP!!!

Newsgroup: comp.sys.atari.st
Date: 1997-09-12 00:00:00 UTC
From: firebird@wildnet.co.uk
Message-ID: <34190f77.0@ispc-news.cableinet.net>
Source record: 116987

Hi All,
I've just upgraded to Papyrus 5 and have encountered a little
problem...it will not print colour pictures!
I've tried adjusting the memory and printer settings to and the best
result I got was half a picture in black and white! :(

What do I need to change to get it printing correctly?
Do I need a specific printer driver or to enable graphics printing
with the Escape codes and if so what are they??

Does someone have a driver for this printer that works with Papyrus 5
they could send me?!!

Apart from this little problem Papyrus 5 is an excellent program,I
just want to use it to it's full potential! :)

Thanks for any help recieved!

My set up is a Falcon with 14megs of RAM,SpeedoGDOS v5,NVDI v2.5 and a
HP Deskjet 560C printer.

3201. New Lower Prices! Atari!

Newsgroup: comp.sys.atari.st
Date: 1997-09-12 00:00:00 UTC
From: bensmith@kelly.teleport.com
Message-ID: <5vb112$30i$1@kelly.teleport.com>
Source record: 116992
Cross-posted to: or.forsale,pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4. (2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs or E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an order of enough of my stock. One example, a customer ordered over $200 of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125 Mono Monitor with a Built in Monitor stand and an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive plus a modified 800xl with a built in Translator on a switch that will run older Software without a Translator Disk Plus Lots more new 8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

No, I don't think TOS has anything to do with it. Your hardware just can't
do it. I have the same setup (Falcon w/VGA monitor). If you had a better
video card or RGB monitor then mabye TOS 4.92 would let you _select_ that
mode.

> everything set up properly, and maybe it has to do with the AES revision
> (which I don't think I have)... Anyone know anything about this?

Again I don't think it has anything to do with AES or any other software.
If the hardware won't do it, it won't work.

3204. Falcon and video cards

Newsgroup: comp.sys.atari.st
Date: 1997-09-12 00:00:00 UTC
From: lynxpro@aol.com
Message-ID: <19970912092001.FAA12938@ladder02.news.aol.com>
Source record: 116995

I was just thinking about this.

I've seen text files on modifying ST's to use VLB videocards for VGA graphics. However, I haven't seen any files on doing the same for the Falcon... Sure, I've seen the Falcon clones promise everything up to PCI video, but I'm talking about modifying the Falcon with a decent video card... Forget Blow Up and all that other stuff, I just wanna be able to pop in an old 2 meg VLB card if it is at all possible. Probably would have to go to a separate case for the Falcon though...

Thanks.

jeremy

Iv'e heard that PC users can use 256K SIMM's for some kind of HD
controller card cache but I still can't give them away. Even in this sea
of PC ignorance, free means nothing.

From: rgoring@REMOVEzetnet.co.uk
Message-ID: <5vbc5l$m18$1@irk.zetnet.co.uk>
Source record: 116998

Hi All,

Has anyone got the printer codes for the Epson Stylus 400 to allow it to
print in 720dpi ?

I need to change the driver for NVDI to allow this to work :-(

The 400 seems to be different than the other Epson Stylus printers :-(

Yours Roy

Linux doesn't require it either, strictly speaking. But the necessary
software emulator is not free, thus not included in the distribution, but
available separately.

I think you have run into one of the problems of SpeedoGDOS v5 it has
bugs. I gave up as soon as NVDI 3 was released and moved on to
NVDI 4.xx end of problem also NVDI is much faster never anymore
printing problems. SpeedoGDOS also had a habit of printing a page of
solid black instead of an IMG.

```
NVDI 4 has a built in print spooler works with outburst or in MagiC
with the print axcelerator.

Hmmm, I'm a bit hazy on NSL now, but isn't 3.21 the version of Notator
that works with a Log3 dongle, rather than the old Notator dongle,
whereas 3.1 won't work with a Log3? Are u sure it is your fonts
that are the problem.

Cheers

>10 years.

In my over 10 years of experience as a computer technician, I've repaired several computers (that is: probably hundreds) because people turned on/off external equipment with the computer switched on, so there is ABSOLUTELY a risk of damage! Both the SCSI-port, as well as the Parallel and Serial ports have a risk of getting damaged by this kind of operations.
Because of the risk of damage, I recommend everybody to turn on their externals before the computer and turn the computer off first. This simple rule of mine has helped several people after they've had the same problems time after time, just a couple of months apart - their problems have disappeared after they started following this recommendation...

Be careful out there!

I guess your old NVDI release make some trouble, but i'm not sure.

My have a HP 660c, NVDI 4.11, and the latest release of papyrus. (5.22)
That works nice for all documents with included color pictures. 16/256 colors)

I don't have a printer driver for the 660c, the 550c driver works well.
(Also the 850c driver make that job)

Thanks for the tip. That never occured to me. I am using a Unix server's domain
to send mail as Newsie is having problems with Send mail on the NT server.
I still have to telenet in and see what is causing the problem. Lazy.
Now, using the same server as the nameserver, Newsie and other apps have no problem
resolving host.

Even more happy than before:)

Thanks,

Mike

I dunno what happeded, I once used Thing, and it half wiped C:/
partition, I had no backups! :(. It all came back suddenly after
extracting a zip file. About 3 weeks later, when I managed a recovery
from scratch! Since then I have stayed away from *any* alt desktop
programmes, as they can't be trusted!!!

There's one called Splitter. It has a gem front end but is a tos program really. The reason I like it is because the source code for the guts of the program are included.

Hi Frank!
May I add the program Megaflim which will split files on the Atari
platform, as well as the DOS platform. Perfect if you have a DOSbox
at work, and an Atari at home!

It's almost certainly something wrong with the OVL. I've since tried
using Demon's proxy server (which is usually more trouble than it's
worth), and it connects fine that way (probably explains why some
people have had no trouble, too). Anyway, Thomas's other addresses
work fine so the problem is solved in this case.

30 pin 1meg SIMMS, partity doesn't matter either. You can probably pick them up quite cheaply locally but if not then call Dabs Direct on 0800 558866, they sell them for just under 6 quid including VAT. Make sure that you do mention that they are for an Atari and you are pretty they will work but ask if you can get a refund if they don't.

3232. ST+NT - what next?

Newsgroup: comp.sys.atari.st
Date: 1997-09-12 00:00:00 UTC
From: guy@swampdog.demon.co.uk
Message-ID: <34198bda.5852545@news.demon.co.uk>
Source record: 117023

Hi folks,

After far too long I've got the atari sort of up and running again,
Here's the $64000 dollar question ...

The ST is on com2 and they talk via dumb terminals but what I want to
use is TCP/IP and route through NT. Not a lot to ask is it? <G>

Firstly, is it possible for NT Workstation 4 to be configured to do
this? If so, how? And can it deal with simultaneous SLIP and PPP?

If not, I don't suppose anybody out there has written an application
which can do this. I'm thinking along the lines of ...

com2 -> NT proggy -> winsock

... that is, the app "merely" takes the TCP packets coming in from
com2 and makes the appropriate winsock calls, naturally performing the
reverse action for their receipt.

Bearing in mind I've only had NT installed for a few days there seems
to be no way to tell it "hey, there ain't a modem on com2, don't
bother about it, just accept TCP is happening there and deal with it".

Hope you all can help!!

A strange floopy story

Your floopy problem does make remember mine ... a few months ago,
suddenly both floopy A & B didn't seem to answer as before, though
sometimes they continued to work at reading and writing they were
becomed very very slow ... I did reboot and wait a lot of time between

boot operations ... nothing to do, they refused to act as normally they
did before ...

The only way I have found to restore them was to use the Diagnostic
Cartridge from Best Electronics ... I did all the test about floopy,
and after that ... miracle the floopies worked like before ...

Like you I own a TT ...

Thta's a bit tough on Atari. The ST parallel port is more flexible
than the PC one - all the data lines are I/O - the problem is that
it's different.

>Any help is very much appreciated. Mark, in Ottawa

1) Boot from your floppy drive
(may need to hold down the ALT-CTRL-SHIFT keys, I don't know which one
works but holding all of them down while powerup should do the trick).
2) Then run your backup copy of your harddisk driver from a floppy.
This will make your harddisk active.
3) Then select "install devices" from the desktop menu.
This will bring up your harddisk icon.

The default icon will be used. I suggest that you do a harddisk check as well
using a good harddisk checker. Normally the error message "failed to allocate
window memory" means that the ST have run out of environment space (or
something similar) and cannot proceed to show you the desktop. It may be your
NEWDESK.INF file is trashed or corrupted, so you can overwrite it by selecting
"save desktop" on the menu. (I would backup the old NEWDESK.INF first before
overwritting). Do this after the check.

Since you replaced the original RSC file, you may need to do an undelete. I
suggest that you don't write anything onto the harddisk if you want to
undelete the file. Use your floppy drive to bootup.

BTW, if you don't have a backup of your harddisk driver, you can download the
AHDI program from any good FTP site.

HTH

Hi Terry,
Since you have more problems in TC, I'd suspect that you need to do a CPU-clock modification. It's the same modification that fixes problems with Cubase Audio - it stabilizes the CPU clock pulses and because of this, the SCSI (and other bus activities) become more reliable.
If you have an accellerator board, the problem might come from too high a speed for your motherboard (all of them are individual, it seems...). If you have added more devices (HD's, CD-ROM's etc) to the computer recently, I'm even more certain that the problem is related to the CPU-clock modification (if you haven't terminated the SCSI-chain faulty).
The modifications can be found on my homepage - troubleshooting section - and if you have any more questions about them, feel free to contact me.

>in LED Panel) on steady. The only way out of this is to turn off the
device
>and then turn it back on (no need to reboot), then press Cancel in the
alert.

DON'T DO THIS!!!!!
If you switch SCSI-units on/off or connect/disconnect them when the Falcon is switched on, you have a high risk of damaging your computer (you will eventually blow up your SCSI-chip and before that happens, you might encounter lots of unexplainable problems because of the wear on the chip) - I've had to repair several Falcons because people have switched on/off SCSI units.
Get HDDriver 6 or later instead - it resets the SCSI-bus if it locks up and you won't have to switch units off/on to reset the bus.

Best regards,
Claes

3246. HEEELP! TT floppy croaked!

Newsgroup: comp.sys.atari.st
Date: 1997-09-12 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5vaheq$hhi@alexander.INS.CWRU.Edu>
Source record: 117126

Does anyone have any idea what happened? All of a sudden, no warning,
the floppies on my TT (BOTH A and B) stopped working. I was in Thing, and
pressing alt-A or alt-B just give me dings (one bell sound)! I quit Thing and
tried to open a floppy from the newdesk, and it gives me an alert box
"Device A: does not exist"
Has anyone ever had this happen to them, and/or do you have any idea
what it could be??? Everything I try to do reports not here. For example
Diamond Edge, has the floppy boxes grayed out.
Under desktop, if I click "mount devices", all the hard disk icons
show up on the screen but no floppies. If I try to cold boot from a floppy,
it simply uses drive C:
One more clue. If I open the .cpx for show disk drives, (I forget
the mane but it comes up as "show room in hard drives") C and D are missing,
no bar at all! but C and D; are there, read, write etc.

HEEEEEEELP!

Boris

On 11 Sep 1997 22:21:05, Bob Shuster wrote:
> Is there some compression program that will allow one to segment files
> ("split" files) across several floppies?

There are a couple of programs. Splitter will segment large files into user defined sizes onto your hard disk, which you then copy onto floppies. My favourite although the program is only in German (and my understanding of that language is limited) is Schnipp. Actually two programs, Schnipp and Schnapp, one will write a segment of a large file directly to a floppy, using all available space on that disc, and then prompting you for another disc until the complete file is split and copied. Schnapp will knit up the split segments into one file on your destination disc.

I believe that I found Schnipp on the Paderborn or the funet.fi ftp site, but I could mail it to you if you can't find it.

: Yes, for TT only though. THere must be a link somewhere in my Quick FAQ.

AFAIK, LINUX 68K works with all Ataris supplied with a 68020/68030 plus
copro.
This includes TTs without FPU-bug, Falcons updated with a copro
and STs with an acceleration card (FRAK? with 68020/030 plus copro).

The CD ALD (atari linux distribution) was told to be updated some time ago,
but until now everybody still waits for it.

Source record: 117133

I just started toying around with TOS 4.92 on my Falcon, and I have this question. What the heck happened to True Color mode on a VGA monitor in 80 columns? I understood that TOS 5.0 (aka 4.92), was supposed to finally be able to do that, but I can't get this thing to do it. Maybe I don't have everything set up properly, and maybe it has to do with the AES revision (which I don't think I have)... Anyone know anything about this?

Thanks.

jeremy

As others said it's probably related to the buffer mod you need to do. I
sometimes have the same problem but it's not necessary to reboot. I thought
this in the beginning but you just have to wait for a timeout (about 1 mn ?)
and then it starts again (here).

3258. What can you use a 68882 on the Falcon with?

Newsgroup: comp.sys.atari.st
Date: 1997-09-13 00:00:00 UTC
From: lynxpro@aol.com
Message-ID: <19970913024501.WAA11280@ladder02.news.aol.com>
Source record: 117039

I'm just curious, but besides Linux and some desktop publishing programs,
is there anything else that can take advantage of the 68882 added to the Falcon?

I was just looking over an old brochure for the Falcon when it came out,
and it said that the 68882 was optional, and there is a socket on the
motherboard to add one. Personally, I think it was stupid of Atari not to
make the 68882 standard, but then again, we're talking about the Tramiels,
and the word "wisdom" is not synonimous with their name.

But anyways, the 16mhz version of the 68882 is probably really cheap, so I
thought I would just buy one if there'll be any improvement in things.

>multitask application when using CAB? Help
>thanks, lewis

Hoi,

Although multitasking isn't obligatory it's strongly recommended. As
for Cab 2.0 I hink this version contains lots of bugs. Since I use Cab
v2.5 I haven't encountered serious problems. On my TT it runs very
smoothly.
Because you have only 4 mb RAM it's recommended not to use much auto
prog's and acc's.

System Solution (England) should have the English version very soon
now (if not already). Try sales@system-solutions.co.uk

Try also Computer Direct (Canada) info@compdirect.com

Hope this help

>from scratch! Since then I have stayed away from *any* alt desktop
>programmes, as they can't be trusted!!!

You're joking I suppose. I'm been using alternative desktops since my
early Atari days on lots of different machines. I've used Neodesk,
Tera, Nodesk, Gemini and now since more then a year I use Thing. I
never have encountered problems. Thing (and other alt. desktops) can
do things you can't do with the normal desktop.
In fact I can't work with the normal desktop as I never have used it.

As for the problem of Boris I don't know for sure but can it be that
the powersupply of the TT is a little to narrow to deliver enough
power for the floppy drives. Me too have a second floppy drive
connected to my TT. At first there wasn't a problem but since I've
added a CD-ROM (although I don't think the CD-ROM is taken power from
the TT) I nearly can use my second drive.
Once I've connected a graphic tablet on my TT. This tablet was using
power from the modem 1 port. From that moment on I couldn't use my
floppy drives anymore simply because there wasn't enough power left to
drive the floppy drives.

I don't think Gemview is shareware. Imagecopy II also offered these facilities and did cost 19.95 UKp from the FAST club.

I bought their file GR420 'Image tools 1' which contained a multitude of options and the used Graphic Workshop on my DOS palmtop to translate to PC or MAC and of course, originate to a GIF or PCX or IMG to move over to the ST.

ANY .PNG filters arround yet anyone?

The FAST club were on Tel:0115 945 5250 Fax: 0115 945 5305 and are online somewhere I seem to remember...

From: All@Sea
Message-ID: <15_All@Sea>
Source record: 117049

Hiyawl.....

Due to some confusion problems with timestamps etc. on the ST+ WWW pages I'm moving the release date of ST+ forward by one day, from now on, ST+ will be released on the 1st of every month as opposed to the last day of the month, this means it will seem as though there is no September issue, there is only it'll be moved [released] on October 1st :)

Feel free to e-mail me with any questions etc. or reply here :)

Hi Bruno, on 04 Sep 97 you wrote: ...respect, brethren
bh>
bh> I have a Falcon with NVDI 3, I assumed to add new fonts you simply
bh> had to store them in the font directories BTFONTS or GEMSYS, reboot
bh> and use programs supporting GDOS. But it does not work!

They need to be in BTFONTS, as specified by the path in the NVDI Fonts CPX.

bh> For example, EVEREST can only the standard NVDI font MONACO.

Have you actually tried anything other than Everest? Everest only handles
non-proportional fonts, like Courier and Monaco.

Really? Hmm...almost everytime I get a message with an encoded file in it
with no header, ESS won't decode it properly. Maybe because this one was
actually text and not binary? Oh well, anyways, I use ESS code for probably
95 percent of my encoding activities, but Base64 seems to handle the odd
message when it won't. I personally think ESS Code is great! :)

3279. D.Brewood WWW Pages Update: Atari / NeST / Psion (13/09/97)

Newsgroup: comp.sys.atari.st
Date: 1997-09-13 00:00:00 UTC
From: dbrewood@nest.demon.co.uk
Message-ID: <17108046_Beta04_OASIS_NEWS@nest.demon.co.uk>
Source record: 117060
Cross-posted to: comp.sys.atari.st,comp.sys.psion.apps,comp.sys.psion.misc,demon.ip.support.atari,demon.service.homepages

The WWW Pages of Daron Brewood (http://www.nest.demon.co.uk/) have been updated with the following:

- NeST: New List of Users Internet Address's.

- Links: Major update with new links for Atari and Psion.

- OASIS2: New Comment list online detailing the latest concerning OASIS2 alpha versions.

- Psion: My own pages updated with two new macros I've written:

- The Julian Date Macro was created by myself as a 'New Day' marker which I use as part of my diary system. It is designed to work within WORD, but should work within any application. However it does use the Outline feature within WORD so use within other applications is now recommended.

- The Star Date Macro basically inserts the current time (in 24 hour format) into a document with the correct exact Star Trek Star Date shown after it in brackets. Useful for those Trek addicts!

So wander along and take a look, any coments or feedback would be appreciated.

There are several hardware-gizmos available that do just this. I have a
'PC-Keys' adapter myself, two others are 'Perfect keys' and the
Deka-interface. I'm sure there are other alternatives as well.

Hello,

From today, you can find my web site at this completely new URL
address:

****
* http://ping4.ping.be/dipching-drulkhor/INDEX-E.HTM *
****

The old address will stay valid until the first October 1997 ...

http://www.ping.be/~pin10575/INDEX-E.HTM

Nevertheless, to avoid any confusion, I will ask you to edit your
bookmarks now ... and be sure to find my whole site already functional
THANK YOU VERY MUCH

Note 1: my e-mail address stay THE SAME : dipching@ping.be

Note 2: for those frequently using THE ULTIMATE T.O.S SOFTWARE INDEX,
it's now necessary to use the following address:

****
* http://ping4.ping.be/dipching-drulkhor/PRG-IND.HTM *
****

Note 3: if you have any link about me on your web pages, could you
please edit it to make sure that everybody will continue to find the
right way to the dipching ... ;-)

Sincerely yours

Jo

I suppose there is a segmenting option in STZip (although I haven't
checked). You can unzip and unsegment the files with MacZip on a Mac or
WinZip on a PC.

No, that's not it at all! When I disconnected my Zip drive and
tape, and then plugged them back in, everything worked fine, and has since!
Something about the zip or tape, blocked the floppies. The problem
hasn't come back again.

Source record: 117072

I want fonts for Calamus SL, I don't want any special fonts disk, just something I can download and use, I would like to see some of your own work(font creations using any progs).

Also I am looking for a printer driver for 1st word plus, as it appears my printer driver compiling is missing, so either an epson LQ printer drive or this program would help me a lot.

Thanks.

Kev.

I paid $60 CDN a couple of years ago, and found a big increase in speed
when compiling Hi-Soft Basic programs that used a lot of floating-point
math. I know that Gem-View uses it when displaying jpg pictures, and a
tank game called BattleZone uses it to speed up the display.

Ghostscript and a number of other programs written for Gnu-C/C++ can be
compiled to take advantage of the 68030 and 68881/2.

Hmmm. I have always wondered?... How do you test to see if your post
is getting to comp.sys.atari.st by posting somewhere else ?

And if that is an ATARI user new to the internet, he just got a very
sad and off putting welcome :(

<smile>

3298. HELP! TT floppies died again!

Newsgroup: comp.sys.atari.st
Date: 1997-09-14 00:00:00 UTC
From: bdc2@po.cwru.edu
Message-ID: <5vfm5h$l4t@alexander.INS.CWRU.Edu>
Source record: 116935

This is absurd! I have two TT's, and have been trying to
rearrange them so I can give one to my daughter. A couple of nights ago,
I posted about my floppies "disappearing" on one of them. Under thing,
when clicked on a floppy, or typing alt-A, which should open it, it just
dings. Under the desktop, I get a message

Device A: does not exist

And then after making the post to CSAS, and playing with the SCSI port,
un-plugging and then plugging in my ZIP drive, it started working.
Tonight, I swappped memory between them, (one had 4+4, and the other
10+16, both Atari boards) and now the other computer has the floppy locked
out!!! Is there a virus that does this shit? Has anyone ever heard of this?
If I try cold booting for a floppy, the light doesn't even go on.
It's not power shortage, cause the second TT is in a tower case, with a
separate, large power supply. UI am going wild, trying to figure it out.

Can anyone help? Has anyone encountered this before?
CPX's that look at the disks don't see it. It makes no sense to me.

HELP!!!

...And I'm interested to know if the ads are true about the 68000 retro-mode option with the board, and if anybody has successfully installed this, and been able to run Notator SL on such an upgraded unit. I have posted some variant of this question for a solid year on this newsgroup, and not one meaninful response. I therefore conclude:

(1) the MIDI users have no desire to upgrade, and in any case are too busy working on music to surf into this newsgroup, and;

(2) Most of the upgraders are more fond of graphics programs than the music stuff.

Opinions, anyone?

Source record: 116939

Actually I had a problem that happened as a result of hitting the reset button on my 104ST (ICD 16mHz accelerated) when CLEANUP.PRG was doing a bad sector check. Lost the whole 540 mB Quantum hard drive, about 10 partitions, for the next several hours and countless warm and cold re-boots. During this episode my old Floptical, which was down the DMA/SCSI chain as ID#2, would still function. A full report of this appeared in XEST magazine Vol.V .no.3 (March 1997) on page 7.

During the 80th re-boot the hard drive suddenly re-appeared with no apparent file damage. No problems since.

Also in the matter of replacement desktops, I have relied on TERADESK 1.36 for years. 1.39 doesn't seem as stable for some reason.

3304. Selectric CPX problem

Newsgroup: comp.sys.atari.st
Date: 1997-09-14 00:00:00 UTC
From: PWest@fortress.org.uk
Message-ID: <1341_PWest@fortress.org.uk>
Source record: 116941

FROM: pwest@fortress.org.uk
SUBJ: Selectric CPX problem

I had some problems with CixRead re-writing some messages (after partial deletions in a topic) in the wrong folders, which I /think/ I traced back to using Selectric which sometimes 'hangs' in an old path. (At least, I don't seem to get the problems when using the system file selector, though I need to make some more tests.)

However, I originally turned off Selectric just in CixRead by using the SLCTCONF.CPX. This switched it off OK and I got the system file selector as expected, *but* when I use this then whenever I open Everest V3.8 and click on a filename to load into it, /it tries to open all 10 available windows!/ Actually only 7 open (as that is the max. under TOS 2.06) and I get the 'No more windows available' alert 3 times.

Has anyone come across this or anything like it before? And what is the solution, if any? I now switch off Selectric with Xboot and this removes the problem, but it means I have to reboot to get Selectric back (and I do like its features, specially the easy path-changes and autolocator).

Regards
Peter

3305. STFM power supply problem

Newsgroup: comp.sys.atari.st
Date: 1997-09-14 00:00:00 UTC
From: PWest@fortress.org.uk
Message-ID: <1342_PWest@fortress.org.uk>
Source record: 116942

FROM: pwest@fortress.org.uk
SUBJ: STFM power supply problem

Help!

When I came to switch on my STFM today, nothing happened - no LED lower left, no floppy drive start, no nothing. I changed to another lead and checked the internal fuse, but no luck. I took out the power supply pcb and had a good look at it, but there is no sign of any damage, burning or loose connections etc. I then put a multi-meter on it to measure some voltages and found that when I connected the meter from earth to the top of the resistor R8 (near the input transformer and large capacitor) the LED came on, the disk drive whirred and all seemed OK. I repeated this several times, and it seemed to kick-start it every time, and it has now been running OK for some hours.

It seems that something has failed, but what? I don't have a circuit diagram of this particular supply (PHIHONG PSM-2512-2) though I do of a 'typical' Atari one (but mine is different AFAICS). The meter is a very low current one (30 microamp movement) but obviously supplies enough current to kick the switch-mode into action. Moving the resistor around or touching the top wire without the other end being earthed doesn't do anything, so it is an electrical problem!

For the time being I can leave the top of the case loose and use the meter each time I want to start the computer, but this is hardly a long-term solution! Is there a cheaper alternative than a replacement power board at around 30-odd quid?

Regards
Peter

Can anyone tell me which Stik 1.13 or Sting 1.06 is faster? I never got older versions of Stik or Sting working with Cab (either 1.5 or 2.0 demo). I've now got Sting 1.06 and Cab 2.0 demo working together, and don't feel like changing a working setup just to experiment, but it would be good to know which is preferable. Though I suppose it has to be Sting for a pp connection at present.

Hi,- you can setup Newsie to start QED as a default editor. When you save and
quit QED, you automaticly end up with a dialogbox that ask to Send or Cansel.
Click on Send, and you are back in Newsie.

Start up Newsie, go to the Preferences menu, find the Path option. From that
menu it's easy to set it all up. Just click on the different lines to find
the path to the prog. you want.
Don't forget to save your preferences.

cheers

Is there any "crack/patch" for the free ATARI-ST emulation "GEMULATOR
CLASSIC" for MSDOS computers so that I may use a TOS.IMG on harddisk
instead of the EPROM card ? In my AT-486 PC, there is no slot available
anymore (I may prove by photo!), so...

I am not interested in the new *demo* version of the current
GEMULATOR 96 or 97 which works with a TOS.IMG file on harddisk, because
it's a *demo*.

Look at my homepage about ATARI and free emulators
http://home.pages.de/~h/atari.html

Sincerely
Rolf

In article <5vfn7mktm3@News.Dal.Ca>
ag352@chebucto.ns.ca (John S. Gray) said:-

>Also in the matter of replacement desktops, I have relied on TERADESK 1.36
>for years. 1.39 doesn't seem as stable for some reason.

I used Teradesk for several years with no problems. I think I missed
1.39, but 1.40 was fine. The latest version I know of is 1.40A which
fixed a bug which didn't affect me so I never got round to installing
it. Both are kicking around on various FTP sites. Main difference with
1.40 and 1.40A is that they support launching programs in parallel
under multitasking AESs.

These days I use Magxdesk nearly all the time as it supports some
MagiC functions (eg aliases) which others don't, but still use
Teradesk if I revert to TOS. If you want a good reliable desktop with
lots of useful features and not too heavy on memory it takes some
beating. And it's freeware!

All of which probably sounds like a commercial, but I was always a
little amazed that Teradesk wasn't more popular (may just be my
impression, I guess). You got most of the nice bits in TOS 2 without
having to mess about with expensive hardware upgrades. If you're still
using TOS 1.2-1.62 with just the normal desktop and aren't short of
memory, give it a try.

3311. Utility needed : FirstWordPlus ---> PC format text files

Newsgroup: comp.sys.atari.st
Date: 1997-09-14 00:00:00 UTC
From: psmith@zip.com.au
Message-ID: <341bca05.4045055@news.zip.com.au>
Source record: 116948

Hello Atarians,

My ST is working well for my word processing, but i need to give my club correspondence files to another person.

All the files are on my ST in 1stWordPlus format ... hundreds of them.

Is there a utility that can change them in bulk to PC .RTF or .DOC files ?? I know i can change them individually to .TXT files and save them ... but maybe there is a better way ...

Thanks to anybody that can help - I'm sure this is not a new problem.

Peter

f> OOPS!! i used a new file to replace my Deskicon.rsc file on my boot up
f> drive, and now I can't get a desktop!(I was trying to get different
f> icons) I get a message saying"failed to allocate window memory"
f> How can I get into my HD and change back to the original RSC file?

You can power up your ST after the hard drive is initialized, then hold down SHIFT CNTRL and Alternate, this should instruct the ST to not Boot the drive, you can then install the drive C icon and deletethe deskicon.rsc file.

Alternativley if you are using ICD or HD Driver, you can hold down a drive/partition letter key coresponding to say drive d, the HD software will then attempt to boot a different partition, which obviously is not auto booting. Then you can open the C drive and delete as appropriate.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

STiK 1.13 sure seems a lot smoother than STiK 1.12 under CAB 1.5. I think it is
more of a difference of interaction with the OVL more than anything.
The actual transfer rate is still the same on my modem. It's just that
it executes everything much better.

I never really had a problem with most versions of STiK. The latest version
of the CAB.OVL file really inproved performance and reliability.

I have only had STiNG working with a slip connection. Even using CSlip, I
didn't notice any differece between STiK or STiNG here. STiK 1.12 edged out
STiNG mainly because of reliability (compaired with the previous version of
STiNG). I never managed a PPP connection with the latest version, but
I didn't try very hard as Slip is available to me, and causes less hair
loss to currently setup:). So I guess I would say that STiK 1.13 performs
better than the previous version of STiNG.

Most of the problems I have had are server problems. The last one being
trouble resolving under the new IP I signed up with. Nick recommended I
try another providers nameserver. Bingo, that worked. So, to really confuse
matters, with my new IPs NT server, I use both the send mail and nameserver
from my old Unix providers server with Newsie for sending mail and running
FTP. I guess until they monitor activity there, i'll be ok;).

I know what you mean about messing with a working setup:). With so many releases
of STiK and associated files, it's pretty much second nature now to setup, and

I am very pleased with the performance and reliablility. I have seen a few post comments that the way they have STiNG PPP setup, it is slow, but a few others say it works fine. I think if the docs (for STiNG) were seperated to cover dial up connections and direct connections seperately, it would be less confusing. Who is using an Atari connected directly to T-1/T-10 line? Maybe i'm confused on the subject.

Anyway, setting up STiK, 1.12 or 1.13, on Falcon anyway, is pretty much cut and dry. HSModem in the auto folder (if your using V7, use modem.cpx too). I'm running MiNT and load HSModem and STiK afterwards. Other than server problems, I can't think of anything special to do, except install it correctly:).

Mike

3314. IDE Hard disk on Atari ST?

Newsgroup: comp.sys.atari.st
Date: 1997-09-14 00:00:00 UTC
From: Mario <corus@vz.tel.hr>
Message-ID: <01bcc10f$719b3ac0$18e21dc3@corus>
Source record: 116951

This is a simple question: a friend of mine owns Atari 1040 ST. Is it
possible to connect an IDE hard disk (Quantum Fireball 1.08Gb) with it?
If the answer is yes, how should it be done?

I would be very thankfull for any kind of answer.

>Something about the zip or tape, blocked the floppies. The problem
>hasn't come back again.

That's the first time i hear trouble about yours.
Make sure if you have a correct termination with your external scsi device.
Don't plug in or out ANY scsi device while your tt is ON !!!
You damage the port!!!

The internal floppy will quit his job by dma trouble..
Check your software first.
If you have some wrong external connections, you got dma trouble.
Simple it's only a overload with a wrong termination..

Regards, Robert

Source record: 116953

Hi Peter,

In the past I've successfully used a program by Robert Best to convert WordPlus docs to WordPerfect v5 format. These then read very well into WP or MSWord (actually I found Word6 did a better job than WP, for some reason) on a PC, with almost all formatting coming through intact.

The version of the program I have is called wp29.app and was a commercial product (I bought it years ago directly from Robert Best, who lives in the Netherlands). I believe these days there's a demo of it on some of the ftp sites.

If you need more info drop me a mail and I'll see if I can look up addresses, etc.

AVSERVER an environmental variable is used primarily under multitasking systems, eg MagiC, Geneva etc. It states which program is in charge of the AV-protocol, a communications standard between different programs. It means filenames and keypresses etc can be passed between programs - one program can instruct another to load a particular file without reloading the program etc...

If you're singletasking, the AV-protocol can be used to call a desk accessory (eg ST-Guide, 1st-Guide etc) to open a file. If you can find a desk-accessory text editor, you can use it in Newsie etc.

l>
l> The answer to that is no.

The reason for the "no" answer is that the Atari's parallel port was only designed for use for printers and doesn't have all the pins connected, that you'd find connected on a PC.

Buy the SCSI version, its faster than the parallel version anyway! You won't need any specialised software (apart from your Hard Drive software) to run it

WRONG! Iomega SCSI Zip Drives DO have termination. There are two switches on
the back of the drive between the two SCSI sockets. One is to switch IDs
around, the other is to switch Termination on or off.

Stop that! It's a chance to loose the hole mainboard!
Do not contact evrything on the pcb to earth! (What a risk!!)

But sorry, i don't have a ciruit diagram of that type of psu.
Some other internal atari psu's are neary the same.

So i will have a look to the old psu from a 1040 STF :

R8 is a safety resistor with 1 Ohm in line to a Transistor BU508 (Q2), the driver
of the pimary side o the transformer. I think your psu lost his primary clock.
Check R4 (330 Ohm, 2 Watts)
If that resistor OK check Q1, 2SC1384.
Check D1, BYV95A
Check PC1 (SHARP PC817)
Check Q3, TL431 (TexasInstruments)

Check R1, 5D-11 (NTC)!

Check DB1 ~ and ~ are 120V AC IN
+ and - are 120 DC OUT

C4,C5 (both 47uF/250V) must have around 150VDC and more!

I hope you found the parts on your pcb. If not, you have another psu!
Do not touch anything on pcb while the psu is pluged in!

Don't touch the heat sink!
It's more as 200 V on it..

If you can't found any defective part, replace the psu.
(A chance you lost the transformer..) (To expensiv, get a new one)

Regards, Robert

3323. POPwatch 2.30 released

Newsgroup: comp.sys.atari.st
Date: 1997-09-14 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <24026793_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 116960
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

POPwatch is a POP3 mailbox tool for use with STiK and Oasis1, Oasis2,
and NEWSie.

Version 2.30 is now available from my web site (see .sig).

Changes since 2.22 are:

*New 'Reject Message' option to send a 'Failure' DSN to try and ward
off junk email. Creates a REJECT.LOG file. See POPWATCH.TXT for more
details.

*Keyboard shortcuts should now work on keyboards other than UK ones.

*Sequence of OK, Cancel buttons changed to conform to Atari Compendium
standards.

*All LOG files are now placed in a new folder called \LOGS\ and all
TMP files are now placed in a new folder called \TMP\

*Internal bug fix. Now allocates 60bytes for realname *not* 60 words.

Regards,
Gary

I've ordered CAB2.5 inc. PPP Connect from System Solutions and should hopefully get it in a couple of weeks.

I might be interested in modifying POPwatch to use PPP Connect (as well as STiK etc.). To do this I obviously need programming docs for PPP Connect.

Does anyone know if these are publicly available? If so, where I can get them? I guess they'll be in German which is going to be a pain :(

Cheers,
Gary

>WRONG! Iomega SCSI Zip Drives DO have termination. There are two switches on
>the back of the drive between the two SCSI sockets. One is to switch IDs
>around, the other is to switch Termination on or off.

There were early modles of the ZIP drive that did not have a termination switch on them. I have two of them, but they did come with a terminator plug. What I think he was refering to was termination power. Forget which pin on the scsi bus it is, but some units do not provide power on this pin. Fo example my Conner 1.06 gig hard drive. The Link gets it power from the SCSI bus. In my case My Conner Hard Drive and the Link would not work together unless I supply power to this single pin, which is what I did.

STiK 1.13 was indeed a beta. What unfortunately happened is,
an IRC #atari regular (not a member of the beta-testing team)
was having problems with 1.12 and one of the STiK coders asked
me to hand him a pre-configured copy of 1.13 and Dialer 0.85.
Some few weeks later, the customized bundle was found on CNAM
by other members of our team. Apparently, the outsider had
decided to ignore our request NOT to pass any betas along....

I use CAB (the demo version) only occasionally. Mostly I use lynx on a unix server (_much_ faster!). As I have already pointed out in detail (more details can still be given though) CAB is not yet good enough. I won't buy it until it gets _much_ better. There are just too many shortcomings.

That's my reason for not using PPP-connect.

3335. Atari show in Dallas, Texas!

Newsgroup: comp.sys.atari.st
Date: 1997-09-14 00:00:00 UTC
From: smedley@gte.net
Message-ID: <5vho83$nu6$1@gte2.gte.net>
Source record: 116972
Cross-posted to: rec.games.video.atari,rec.games.video.classic,comp.sys.atari.st,comp.sys.atari.8bit

The Event:

Another reminder that the Atari Users of North Texas will be hosting an "Atari show" at the Infomart in downtown Dallas on Saturday, October 11th. While AUNT is primarily an ST/TT/Falcon computer users group, we invite all Atarians - 16 bitters, 8 bitters, and gamers (like me!) to attend. Attendance is FREE!

OK, I gotta admit it up front - the 8-bit computer line will not be very well represented here. In fact, I think my XEGS will be the only machine in this family around for you to fiddle with. But this is a great chance for us all to get together and share some stories. And if you want to bring some of your 8-bit stuff for swapping, post a note in comp.sys.atari.8bit announcing what you have to bring - perhaps some of us can get together and do some business on the side.

Other attractions:

We will also be hosting a pre-show dinner and a post-show dinner to give all Atarians a chance to relax and have dinner in a much more relaxed atmosphere. The pre-show dinner will be at the Hoffbrau in Addison, while the post-show dinner will be at the Bavarian Grill in Plano. If you would like to attend either or both of these dinners, contact David Acklam (see e-mail address later in this note).

At this point in time, we expect ChroMagic, Crawly Crypt, Systems For Tomorrow, It's All Relative, Emulators Inc., and Trace Technologies attend. (This is not set in stone - more vendors may be added, and some of these may not attend after all. I should have a more definite list for you in about a week. But these vendors all showed a strong interest in attending.)

What there is to do:

Along with shopping the vendors, we are planning a few software & hardware demonstrations, including an Atari internet demo (if we can get a phone line from the room cheap enough) and a big chunk of my personal Atari classic (and not so classic) video game collection - free to play all day, as long as you're nice to my stuff! (I'll also be bringing a little bit of trading stuff for any classic gamers out there.) Again, I'll have more solid info in about a week - stay tuned!

There are also plans still being hammered out for a free raffle and some game competitions. I am welcoming suggestions about what games you would like to play in such competitions, and ways to structure the

events. (Probably no prizes for the games - it will just be for fun. But here's hoping we CAN manage to scrounge up a few extra prizes aside from the raffle - anybody got anything humorous to donate?)

BTW, if you are not a ST/TT/Falcon owner, contact our vendors and let them know what platform you would be interested in shopping for at the show! For instance, I know SFT stocks classic and modern Atari gaming stuff - their e-mail is sales@SystemsForTomorrow if you want them to bring some of these items with them.

If you can't go, ADVERTISE!

And lastly, if you're a vendor and would like to place an ad in our show newsletter, which will be handed out free at the show, contact Dave Acklam ASAP! Rates a VERY CHEAP for this advertising, but it goes to press very soon so contact him NOW! Last year we attracted Atarians from all over Texas, Arkansas, Louisiana, and Oklahoma for this show - let them know you're there to sell Atari products to them, even if you are unable to bring your goods to the show!

For more info, contact:

David Acklam, President & Editor: d-acklam@ti.com
Dan Mazurowski, Secretary: smedley@gte.net

Boris.

Homa Systems in Canada has NOVA cards for Falcons and TTs in different configurations. Their webpage is

http://www.magmacom.com/~nima

They are not "cheap", but the specs are very impressive, and surely can squeeze some of the potential of your multisync :-).

Regards.

Daniel.

I have to admit my ignorance when it comes to music software, I use my
Falcon primarily for DTP, database and software programing applications.
However, I'm sure that I once saw a list of commercial/shareware programs
that made use of the 68881/2 somewhere on the WWW. If you have the time,
use Altavista to search for the words "Atari Falcon" --- I'm pretty sure
that this is how I came upon the list.

No, of course not. It will work with a VGA (if it supports the 72 Hz frequency) - but you have to know which pins in the plug go where. There was a diagram of the connections in one of the "ST Formats" - maybe someone could provide it as I gave all my ST Formats away.

Hi,

Can anyone tell me, simply, and in English, what "AVSERVER" is
and what it's for?

I'm trying to run Newsie and using QED as my text editor and I
suspect that "AVSERVER" will allow me to have QED active without
having to quit and reboot QED for every message.

Is this correct?

Can anyone tell me how to leave an external text editor and return to
the Newsie "Send Message" page without having to quit and reboot my
text editor every time?

Much obliged for ANY help.

Stephen Angelini / trax@cedep.com

That may well be the difference. I just started using it in the last 6
months or so, and haven't been able to find a way to register it. I can't
decode more than 18-20 files at a time before it quits out with an error.
I'm betting that the registered version cures all these "problems". :)

There are others but you won't have much more luck with them,
some disks just don't go, and need to be recopied - see my web
page (URL in my sig).

SUBJ: Tos images (not for an emulator)

As I've said before elsewhere, Goodman's PD library in the UK offer a 'TOS CHANGER' disk that allows booting with TOS 1.0, 1.02. 1.04. 1.62, EOS or CHAOS. This is done with an AUTO-folder loading program.

SUBJ: Falcon SCSI problems

I don't know the innards of the Falcon, but I wonder if this could be down to timing problems? There has been some correspondence in one of the topic of SCSDI and similar problems when accelerator cards are fitted, so if your Falcon's timing is off for some reason that could be the cause. I may be completely wrong, of course, but it's worth a check...

SUBJ: segmenting files on Atari ST

In a message of <13.09.97>, bob.shuster@webphoria.com (90:102/0.99) writes:
bs> Is there some compression program that will allow one to segment
bs> files ("split" files) across several floppies?

Yes SPLITTER.PRG together with SPLITTER.TTP will do this (the former is a GEM shell for the latter). This was on an /Atari ST User/ cover disk (9/94) and is available on line (eg from stapplications/files topic on Cix). In its self-extracting form (x_splitt.tos) it is under 78 kB, so if you can't find it I could Mime or UUE it and send it to you (let me know which coding you can handle).

>some "ALT=" messages..
>

Why don't you just have a GIF with the same colour as the background. This is a well-known method of hiding text on both HTML & Wintel.. This way, you can have your ALT= on text only browsers while nothing shows up on Graphical browsers.

IIRC, but may be wrong, transparent GIF means that the GIF display the shape outline but not the box outline of the GIF. This is done by making the background of the GIF to be same as the background of the HTML page. In the transparent GIF maker I use (on Wintel .... boo hisss) they just replace a particular colour (ie your GIF background) with a colour you specify (normally your page background), not spectacular about it.

>When using Giftrans to show which colours it contains it surprisingly shows
>me two colours:

>Athena $ transgif.ttp f:\internet\html\www_docs\images\atari.gif
>GIF color table:
> 0: 255,255,255
> 1: 0, 0, 0
>Athena $ transgif.ttp f:\internet\html\geocity\pages\images\blank.gif
>GIF color table:
> 0: 255,255,255
> 1: 0, 0, 0
>Athena $
>

I am not surprise, it's the colour table you are seeing, not the actual data.

3362. Old HD on M/STe was replaced successfuly!

Newsgroup: comp.sys.atari.st
Date: 1997-09-15 00:00:00 UTC
From: solo@midijam.kiev.ua
Message-ID: <H.ekBL.8oqVjPGGUPY@midijam.kiev.ua>
Source record: 116885

Hi everyone who's use MEGA/Ste with old internal HDs!

Perhaps it will be interesting!

After some scares and confusions I successfuly replased my old
internal 48 Mb Seagate ST157N to the new 540Mb Seagate ST5660N!!!

Higly recommend do it everyone who using same ATARIs and up to
this time do not makes it!

It was really very simply.

Some tips when you'll be installing your hardware part:
"""

1. Jumpers ##1-6 on jumper block of new HD must be removed. So you
sets SCSI ID#0 (as required MEGA's internal SCSI).
2. No need doing any operations with all another jumpers. Let it stays
without changes.
3. Remove old and mount new HD refering onto installation guide.
4. Possible we would be have some problems with attaching of the remote
LED cables. 'Female' of this cables more fat than pins on some new
HDs therefore the connnection between remote LED female-jack and pins
may be not so hard and the contact will be bad.

Some interesting things when I formatting my HD:
"""

I tried to use some drivers. Reactions of each from them shows below:

HDDriver v4.5 - ST5660N didn't recognized quite!!!
AHDI v5.0 - was recognized and procedure of the formatting
finished perfectly well! Partitioning -- as well
as (50-160-160-170Mb)!
AHDI v5.4 - was recognized but HDX didn't want to format it.

Do not asked me about so strange results! I don't know about causes
nothing. I only was wondered to so strange behaviour of this drivers.

Does anybody may to comment it?

Send me any questions. Will be very glad to help.

SPECIAL THANKS: 1. To Roger Cain personally! Without his helpful I
"""""""""""""""" even has not a risk do it!!! Roger, are you heart
me? :-)
2. To whole 'comp.sys.atari.st' when all has been
disscussed my question about this problem.

P.S. Sorry for my bad language.

>

Well, the docs that were included do state that it was a beta. If
a developer does not wish his beta software distrubited, then
they should have the beta testers sign a statement indicating this.
Yes, your name was clearly present in the archive.

Personally, I could really care less about its performance with MagiC.
While it is (MagiC) a major upgrade for most all Atari users, it seems
to cause more confusion than anything else in this newsgroup. Especially
such bullshit as Falcon hardware being the root of all evil. That, ASH,
is utter bullshit. If the Falcon hardware is so bad, why is it that MiNT
and N.AES are so stable?.....

Anyway, if one of the STiK coders would like me to delete V1.13 from
my harddisk, I would glady do so. V1.12 works fine as well. However,
I think that on this end, V1.13 has had a pretty good ringing out on
this Falcon, and gets a thumbs up. I haven't found the bug yet, and I
usually have NEWSie,Antmail,CAB all running at once.

Maybe it's my hardware configuration that keeps me from being a beta tester:).

Falcon 040/40~44Mhz/64/4 RAM-Nemesis-ATI Mach 64 Super NOVA graphics-MiNT/N.AES
and shit load of IDE and SCSI device/SupraExpress 33.6K (all self-installed).
No problems here. And I ain't no software or hardware wizzard neither:).

Mike

3364. (CA)FS: 4160 STE, MEGA-ST 4, SLM 804

From: q-funk@citenet.net
Message-ID: <5vig9lfdb1@cti01.citenet.net>
Source record: 116887
Body handling: HTML body converted to readable text

Thanks to those who responded to my previous posts,
my MEGAFILE is now sold! ;-)

The following items remain FOR SALE/TRADE:

* 4160 STE (TOS 1.62, 4 Mb) ==>> ie: 1040 STE @ 4 Mb
* MEGA-ST 4 (TOS 1.04, 4 Mb)
* SLM 804 Lazer Printer
* STM 1 Mouse
* Softwares
DTP: Timeworks - Publisher
Soft Logic - Publishing Partner
Music: Dr.T - D-50/D-550 Editor
Dr.T - D-10/D-110 Editor
C-Lab - Notator SL 3.1

Offers from Canada and United-States only!

Preferably TRADE against following products WANTED:

* MEGA-STE (TOS 2.06, 4Mb Ram, Internal HD)
* STacy 4 (TOS 1.04, 4Mb Ram, Internal HD).
* Crazydots-2 graphic card for TT (or equivalent ET-4000 card)

NOTE: Canadian banks cause troubles for cashing foreign currency
of any kind, including American. This can be avoided by an
electronic fund transfer (Western Union or similar), which
is usually cleared within 48 hours of transaction.

Nonetheless, if you're interrested in trading your MEGA-STE
or your STacy, we can arrange something, as no money would
be trading hands accross the border.

Complete list of items I'm selling or looking for on my homepage.

: >>Firstly, is it possible for NT Workstation 4 to be configured to do
: >>this? If so, how? And can it deal with simultaneous SLIP and PPP?

I was unable to configure Windows NT Workstation 3.5 to work with a direct serial connection. It insisted that it should talk to a modem, and there seemed to be no way to tell it that there wasn't a modem. I did not look into it in great detail, however, and since I don't use Windows NT any more I haven't tried to find out the answer.

Someone came up with a solution for Windows 95, however, perhaps this also applies to Windows NT.

: >>Bearing in mind I've only had NT installed for a few days there seems
: >>to be no way to tell it "hey, there ain't a modem on com2, don't
: >>bother about it, just accept TCP is happening there and deal with it".

Exactly the problem I had...

: >But I also would like to network my Falcon and PC together using
: >TCP/IP so if anyone knows...

: Must be something out there. After all I'm sure we're not the only
: ones in the world who want to network via the com ports!

Probably the best thing is use Linux on your PC, then you don't have to bother with these silly problems about Windows...

The problem is not with the Atari side but with Windows not accepting that you can use a serial connection without a modem.

Otherwise perhaps the person (I forget who it was) who solved the problem for Windows 95 will respond to your query, and hopefully that method would also apply to Windows NT.

Matt Wilimzig (spunkie@primenet.com) wrote:
: Does anyone know where I can get an English version of CAB 2.5, if it
: isn't out yet, any news when it will be. What is the best set up for
: it? I'm using CAB 2.0 and having trouble with it. I am a novice
: computer user and I love my Falcon. Anyone know how well 2.5 work.

My experience with CAB 2.5 is that it works very well, at least with the CAB-for-MiNTNet overlay. I didn't have such good experiences with the CAB-for-STiK overlay, however it did work such that it was usable.

I never notice any crashes with CAB, and it seems to display all the pages I have tried (lots!) without any trouble. Data transfer in the background is supported, so you can read and scroll the page click on links etc while data (pictures, embedded objects or other frames) are still being received.

Some of the supplied modules are also useful, with an advertising filter module that removes advertising images from WWW pages, an "Auto-surf" module which will download a tree of WWW pages for you automatically, a background file download module and others.

Over all, I only have good things to say about CAB 2.5!

: I'm using a Falcon030 with 4 megs and a hard drive. I have it very
: stripped down with only the bare essentials on it. Should I run a
: multitask application when using CAB? Help

I think 4MB might be a bit tight for multitasking any large programs, and CAB seems to require a significant amount of memory when displaying large pictures. Of course being able to multitask is an advantage in any case, but if you run out of memory to often perhaps you will find you have to stick with running only one program at a time.

I suppose you could measure the volts where you stick the meter and
then put in a LARGE resistor to simulate your meter taking a few
microamps.

Sounds a bit like old age and some component gone marginal. Check some
other resistors, especially around the small transistor which drives
the base of the switcher. These may have cracked etc. and may not be
supplying enough bias current to the switcher.

Neither CAB 2.5 or PPP Connect is available HERE in English, I'm
afraid, Magnus. I wish it was - apparently the doc. translation is
holding things up.

So, ATM, STiNG is the only PPP solution if you don't use MiNT.

Well, I inventoried all my Atari stuff and have quite a list. Browse through, take a look, and let me know if there is anything you would like. Here goes....

HARDWARE:

PCM124 Atari PC Monitors-NEW-$30ea.
NX-1001 NLQ Star Multifont Printer-multi paper path, auto loading,prints on up to 3ply paper, original box, like new.-$30

A/B Video BOX - 15 pin female jacks - 3 A-B & Input-Output-$15

SC1224 Monitors - units power on and have displays but all need different types of repair. Ask whats available. $10ea.

Oivetti Ink Jet Printer Model PR2300. Includes 20 ink amples and AXIOM 32K Wordstore Printer Buffer. Original Box and docs. $20

NOW FOR THE SOFTWARE.......

UTILITIES-Business-Education- "ALL CONTAIN ORIGINAL DOCUMENTATION & BOX" ** Atari CD's **
TITLE Manuf/Dist Description PRICE

Hard Disk Sentry- Chromagic-disk repair, optimization utility for ST/STE/TT & Falcon030.-$10 (new-shrink wrapped)

PAGESTREAM Release 2.2SE-Soft Logik-Atari Desktop Publishing Program-47 fonts, 100 page manual.-$15

PAGESTREAM ASSISTANT for Pagestream-Spar Systems-ST/STE/TT Falcon. Hypertext personal guide.-$10(shrink wrapped)

THE MUSIC STUDIO-Activision/Audio Light-music program, includes 7 music floppies.-$5

LOTTO DDS-Missionware-Lotto number generation program and lotto database manager.-$5(shrink wrapped)

FLASH II-Missionware-V3.00-Telecommunications/modem software for ST/STE & TT.-$10

ATARI CD MASTER 4.(includes Audio CD Master)-CD Rom access software-HOMA House Canada-Drivers for the following CD's-Infopedia v2.0, Time Almanac, UFOII, SpaceMissions.-$10

Atari FIRST WORD Wordprocessor-$5

EXTENDOS PRO-Anodyne Software-v2.1-for ST/STE/TT/MEGA's & Falcon-CD Drive driver-auto install/enhanced audio player-support for over 40 CD-ROM drives & more!-$5

DATA DIET v1.0-Disk drive compression program-Double Click Software.-$5

MOUSE BOOT v3.d-Boot manager-$2

ULTRA SCRIPT-Atari-A PostScript language compatible interpreter features Lucinda font family for MEGA's & SLM804 Laser Printer.-$2

MULTI-DESK-Codehead-unlimited desk accessories utility.-$2

PHOTO SHOW PRO-STE v2.3-Its All Relative-Kodak Photo CD application for STE & MEGA STE.-$10(incls. Winning Pictures Viewer & PhotoKina CD ROM viewer drivers)

READ-A-RAMA-Unicorn-ages 5-8-Learning activities-$2

FUN SCHOOL #3- DATAbase-Education software-ages 5-7-$5

TYPING TUTOR-Word Invaders-Acadamy Software-learn to type on your Atari.-$5

REGENTS WORD II-Regent Software-A GEM based word processor w/Spelling Checker-$2

*** CD's ***

SKYLINE CD-$15
CRAWLY CRYPT VOL#1 CD-$15
CRAWLY CRYPT VOL#2 CD-$15

3375. ATARI-ST emulation, GEMUL8R.INI

Newsgroup: comp.sys.atari.st
Date: 1997-09-15 00:00:00 UTC
From: Rolf Hemmerling <hemmerling@geocities.com>
Message-ID: <341D1094.1883431D@geocities.com>
Source record: 116898
Cross-posted to: comp.emulators.misc,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy,de.comp.sys.st,fr.comp.sys.atari,maus.sys.atari.hardware,maus.sys.atari.talk,maus.midi,fido.ger.atari,comp.emulators.misc

I would like to use the free ATARI-ST emulation "GEMULATOR CLASSIC"
(Version 3.6, not GEMULATOR 96 !!) for MSDOS computers so that I may use
a TOS.IMG on harddisk instead of the EPROM card. In my AT-486 PC, there
is no slot available anymore (I may prove by photo!), so...

I just downloaded the GEMULATOR CLASSIC executable file, and I got a
GEMUL8R.INI file from a friendly newsgroup reader. This file is
accepted by GEMULATOR CLASSIC, as I may see if I change a parameter for
the RAM size. But: The sender of this initialisation file did not know
exactly the syntax of the parameter to let the GEMULATOR CLASSIC take a
TOS.IMG file and to avoid the scan of the ports.

This does not work in the GEMUL8R.INI file, currently

magic=c:\tos.img
magic c:\tos.img
(so with and without the "=", probably without the "=" is right)

magic c:\magic_pc.os
(from the MAGIC-PC demo)

So what is the keyword (or which TOS version works right), so that no
scan is done by GEMULATOR CLASSIC ? In fact, although I don't own an
EPROM card, GEMULATOR CLASSIC insists on that there is a EPROM card at
port $240 !!!

On their GEMULATOR CLASSIC download page, they say
>Gemulator Classic supports all the same operating systems as Gemulator
> 96: .., TOS 1.0 on disk (the original 520ST disk based TOS) and TOS
> 1.4 on disk (the 1988 developer release), and MagiC 2, MagiC 4 and
> MagiC 5 on disk including versions of MagiC that come with MagiC PC
> and the MagiC PC demo
So it should work, but it does not yet.
The GEMULATOR 96 demo finds the ROM images, properly.
Is there anything special with the TOS on disk (so that these versions
may be recognized, but no other ?)

I would be interested to get all "utilities" and online documentation
for the GEMULATOR CLASSIC, for free.

Look at my homepage about ATARI and free emulators
http://home.pages.de/~h/atari.html

I got all TOS versions from
http://www.fatal-design.com/desktop/

I understand that the MAGIC_PC.OS image needs the C:\GEMSYS folder from the original demo version of MAGIC copied to my local drive C:, as it does with the GEMULATOR 96 demo.

Sincerely
Rolf

Read again: I occasionally do use CAB. Sometimes I want to check that the pictures in my web pages are shown as they should. And sometimes I need to check the frames versions of some of my pages. The "back-button" quirks in CAB are a bit annoying then.

> To use it with Netscape, IE4 or even
> Mosaic? I don't think so, bro'.

There are always Newsie et. al. Not that I use them much, tin and pine are so much handier.

Simon Gornall (simon@oyster.co.uk) wrote:
: I've tried the slattach stuff, but figured out I needed dip. I
: configured dip, and it just hangs. I'm using the device /dev/modem2,
: which at least responds with garbage when I use minicom to talk to
: the SGI.

I haven't used DIP for a while, but when I did use it for SLIP I believe
it was straight-forward.

For a SLIP serial connection between two local machines, however, I just
used slattach and this seemed to do everything necessary.

: (garbage: it returns a few random characters after I press return - I
: assume this is the 'login:' prompt from the SGI, after it's been munged
: somehow)

Perhaps the baud rates are set differently at each end.

: So, I think I'm using the correct device, I think I have the correct
: software (dip), and I think the line works ok. The only thing I can
: think of is that the MiNT drivers can't handle 38400 baud.

I've used 115k2 connections with MiNT without a problem, even with the
older MiNT that supposedly could not handle connections higher than 38k4.
Since you're only using 38k4 there certainly shouldn't be a problem.

: I seem to remember that ST's (Falcons too ?) couldn't drive the serial
: hardware at high baud rates... Is this my problem ? And if so, how do

The Falcon's serial port operates at speeds up to 115k2, I believe.

: I looked through the version of MiNT's tty.c, and it seems to indicate
: the serial lines can go as high as 230kbaud (wow!), but maybe it needs a
: .xdd driver...

Not that I know of.

I am not exactly what is wrong, but maybe my comments will help you to
figure it out.

> I would be very thankfull for any kind of answer.

I know that Hard & Soft (Germany) manufactures a small board with TOS 2.06
and IDE-interface. The Upgrade Shop (UK) also has one, but I believe it's
STe only.

If you can get hold of a MultiBoard you can also add 8Mb fastRAM and a ISA
graphics-card (they costs ~$15) in addition to IDE-disk and TOS 2.06.

Nick
Nope :^(
ST Zip doesn't support the latest version of Zip which will
do what they call 'spanning', i.e. one file spanning many disks.
Fortunately, _most_ ST programs/files will fit on a DSDD/DSHD floppy.

Mjsjazz wrote:

>PS will ST work ONLY with ST monitor...

No, of course not. It will work with a VGA (if it supports the 72 Hz
frequency) - but you have to know which pins in the plug go where. There
was a diagram of the connections in one of the "ST Formats" - maybe
someone could provide it as I gave all my ST Formats away.

It will certainly work in monochrome with just about any SVGA monitor (and
some VGA ones), but few SVGA monitors will work with ST colour resolutions:
the refresh rate is so low that most monitors refuse to do it.

For mono you can wire up a 13-pin ST-style nplug to a 15-pin SVGA socket as
follows:
ST pin 9 (hsync) to SVGA pin 13
ST pin 11 (mono video out) to SVGA pins 1,2,3 (R,G,B)
ST pin 12 (vsync) to SVGA pin 14
ST pin 13 (ground) to SVGA pins 4,5,6,7,8,10,11
and to ST pin 4 - this tells ST it has a mono monitor attached

This works fine for me.

For colour, leave ST pin 4 empty and connect ST pins 6,7,10 to SVGA 1,2,3
respectively (or so they say: I can't vouch for this one). If you miss the
keyboard click, the mono sound output is on ST pins 1 (signal) and 13 (ground).

At own risk, all disclaimers apply ...

I understand the ExtenDOS program for dealing with CD-ROMs works
with several drives, but not all drives.

I am looking at a internal 2x drive by Toshiba (model XM-4101B)
(for $30, fro HSC - www.halted.com)
and a 2x internal NEC (no model # avail)
(for $35 from Alltech - www.allelec.com)

Could you ExtenDOS users out there consult the list of supported
drives and advise? Probably the NEC would work. I have my doubts
about the Toshiba, since the ad says something about being produced
for Sun.

A good point. Currently CAB is the only client.

> Because it works? As PPP-Connect will be released in english very soon
> and with
> programming docs I bet that you will have as many clients as STiK if not
> more within

The point is that I have a MiNTOS/MiNTnet-setup that's excellent, and allows me to have the Falcon permanently hooked up to the internet. I have several servers running (Web-server, ftp-server, rsh-server, telnet-server, smpt-server, pop3-server...), and the clients are the standard unix-clients (pine, tin, telnet, NcFTP, ircII, archie, rsh...) which are superior to any GEM-based STiK-client.

And I happen to *like* MiNTOS and unix in general.

> a week or two. But if no one buys it (it's also bundelds with CAB which
> is
> at the same price as it was before PPP-Connect come with it) no clients
> will be

Not true. CAB 2.5 is more expencive than 2.0, and the upgrade from 2.0 to 2.5 costs nearly as much as 2.0 alone. Why should I pay for something I don't want/need? ASH is pushing PPP-Connect onto STiK/STiNG/MiNTnet users to get into the market, if the product is up to the usual ASH-standard it should sell by itself. There is a lot of good software out there, but I don't need all of it.

What if you suddenly have to pay for NVDI as well the next time you want to upgrade MagiC? Or can't upgrade MagiC without having to buy Jinnee at the same time?

> done. Why? Sometimes I think that Atari people doesn't want new working

Oh please! I have bought lots of software! And speaking of support, I get much more of that from the MiNT-community than I've ever gotten from any commercial company (except Gribnif and Titan). If they want to keep me as their customer they have to provide some service!

> > This is a pity. Pure C is very fine indeed, but needs some improvements

Yes, the libs definelately needs updating.

you're probably right on both counts. I'd say that 90% of the musicians
I
know that use the Atari for MIDI can't be bothered to join TAF, and are
not
interested in the Internet.
Certainly, a musician I know uses his 1MB Atari (w/out hard drive) for
Notator
STill! yet he went and paid thousands for a MAC so he could do
graphics?!
Him you might find on the Internet, but not in music/MIDI!

Cool.. you know where to send the cheque? :)

>The ST is on com2 and they talk via dumb terminals but what I want to
>use is TCP/IP and route through NT. Not a lot to ask is it? <G>

For NT maybe its too much to ask <G>
This requires ip Masquerading to work and as of yet I dont know if
anybody has written anything like this for NT.. If they havn't it cant
be too long away most other OS have it in some guise.

>Firstly, is it possible for NT Workstation 4 to be configured to do
>this? If so, how? And can it deal with simultaneous SLIP and PPP?

Again I dont know if the SLIP and PPP are on seperate ports should be
no problem as long as the software supports it.. also I dont know if
this type of masquerading software would require NT workstation or NT
server not knowing exactly what the difference is between them <G>

>If not, I don't suppose anybody out there has written an application
>which can do this. I'm thinking along the lines of ...
>
>com2 -> NT proggy -> winsock
>
>... that is, the app "merely" takes the TCP packets coming in from
>com2 and makes the appropriate winsock calls, naturally performing the
>reverse action for their receipt.

The way this would work is that you would give a dummy ip to the ST
and configure the masquerading module so that to the net it appears
there is only one connection under 1 ip address.. the masquerading
module sorts out which data goes to which machine etc.

>Bearing in mind I've only had NT installed for a few days there seems
>to be no way to tell it "hey, there ain't a modem on com2, don't
>bother about it, just accept TCP is happening there and deal with it".

I dont think NT can handle this out of the box.. and I dont know if
there is a 3rd party driver for this.

simple solution is to wipe NT and install linux <G>
Or to use the ST to do the masquerading... but then what would you
plug the pc into...

Nick.

According to Robert's advert in issue 5 of Atari Computing (June 97), the program WP2 converts WordPlus to WordPerfect and back.

You can download the shareware package from:
http://www.worldaccess.nl/~rwbest/home.html

or email him on: rwbest@worldaccess.nl

Or you can ftp it from micros.hensa.ac.uk in micros/atari/tos/r/r003
or /p/p098 or r/r004

Hope that helps!

Kind regards
Mike Kerslake

Hello to all

In <21031993_000003_OASIS_NEWS@the-gap.demon.co.uk> Gary Priest wrote:

>I might be interested in modifying POPwatch to use PPP Connect (as well as
>STiK etc.). To do this I obviously need programming docs for PPP Connect.
>
>Does anyone know if these are publicly available? If so, where I can get
>them? I guess they'll be in German which is going to be a pain :(

i was told, that the BLIP-Docus are the same then the Docus to PPP-Connect.

You need the documentation (the commands are the same as used in unix:
sock_init(), socket(), bind(), listen()) the only differencies are:

sread(), swrite(), sfcntl(), sclose()

which have all an "s" in front of the command.

But you hade to use an Library, in which these commands are defined.

With these Informations i tried to write a program, but i earned always an
errormessage from "socket()". So i the compiled program doesn't run.

The programmer of PPP-Connect (Sven.Kopacz@LB.maus.de) is now learning for
his university exam's, so he is now had to think about another problems.

Should i send you the BLIP-Archive icluding the Programmingdocumentation.
But it's in German!

Greatings Michael

3390. STiK/RAMdisks

Newsgroup: comp.sys.atari.st
Date: 1997-09-15 00:00:00 UTC
From: sonik@zetnet.co.uk
Message-ID: <5vjp1d$sk7$1@roch.zetnet.co.uk>
Source record: 116913

Greetings fellow Atarians!

I've a little problem as regards de facto Atari WWW browser,
CAB. I've got it running ok on my STE 1040 (2 meg) and I've
recently been experimenting with ways of speeding up the cache
to and from floppy disks (I've no hard drive). I thought it may
make things a little quicker with my setup of CAB 1.5,OVL 1.2816
and STiK 1.12.

I thought initially that a RAMdisk utility may help, but after
I've done the necessary there, STiK says it is not loaded as it
'can't load config'. I've tried several RAMdisk jobbies and
STiK doesn't like any of 'em! I've tried RDE, Maxidisk and TrueDisk
and none of them play ball with STiK (or STiK doesn't like them).
I've tried different RAMdisk sizes (from 100K to 500K), different
autofolder orders and using drives other than C:\ but all to no avail.

I'd be very grateful for any comments or suggestions and would like
to hear from any Atarian who's managed to get STiK and a RAMdisk to
co-operate. I'm basically looking to put the WWWCACHE folder
(and its alphabetical folders inside) onto the RAMdisk (drive C)
so that CAB/STiK can get at its files quicker and I therefore have to
spend less on calls to my ISP!

Any thoughts please shout on this NG or by e-mail
Many thanks and keep the faith

Al Ferrier /|\
sonik@zetnet.co.uk

Source record: 116916

Hello!

I recently renamed my AUTO folder to AUTOX to try a software demo
I had downloaded that requires that it be in an AUTO folder, and when I
was finished playing, I deleted the demo (wasn't what I had hoped) and
returned everything to normal, renaming AUTOX to AUTO. When I rebooted and
even after a cold boot, none of my outline fonts were being recognized by
anything (Atari Works, CAB, etc.), so I went to the Outline ACC, and it
said I needed to increase my Misc. Cache. When I looked, it said the cache
required 526346 Kb! I increased it to 99999, the biggest number you can
enter. When I rebooted, it said I had insufficient memory to load GDOS,
even though I looked and I had about 13Mb left! What could be
happening?!?!?! HELP!!!! I appreciate any help anyone can give! Thanks!

Mike Freeman

>for Sun.

Well according to my ExtenDOS manual, Toshiba 3401/3601/4101 drives are shown as being supported by the program for audio and both single and multi session PhotoCD modes (as well as normal data mode of course).

There's no specific mention of 4101B, but certainly my XM-5401B/S works perfectly with ExtenDOS :-)

Kind regards
Mike Kerslake

Then you'll probably be very happy to know that the forward/back/stop
buttons work perfectly alright in CAB 2.5. (Even more responsive than
IE4/Netscape Communicator IMHO). It is now possible to use the scrollbars
without interference when CAB is "loading" pages.
Another nice feature: You can adjust the scrollbars so they are very thin
which makes frames look even better. Can you do this in any other browser?
No, I don't work for ASH. ;-) I just think Alexander Clauss has done a
great job with the new 2.5 version. And yes, I find it well worth the
money.

Greetings, janne

Apologies for the delays over dealing with this - holidays, etc...

Computer Direct will be handling upgrades for Imagecopy 4 to 4.1 and anyone who bought 4.0 recently will be entitled to a free upgrade disk. If you don't want to wait for Computer Direct to supply this then we can binmail a free upgrade (email us at stclub@cix.co.uk).

(Computer Direct were supplied with the current version of Imagecopy, 4.0, some weeks before 4.1 was launched. Much of the confusion over this issue was a result of 4.1 being in a semi-public beta testing state for almost a year before it was launched.)

Computer Direct will also be selling upgrades to customers who bought 4.0 (and earlier versions) from Toad, CodeHead, etc. Contact them for supplies in North America or FaST Club for supplies in Europe and the rest of the world.

Regards
Paul Glover
FaST Club

It would be more logical to use some sort of dummy network adapter -
which I tried first. Having come up blank on that, I thought there
ought to be some sort of "dummy" modem to keep NT happy, except I knew
there wasn't, having had to go through them all to get my external
modem working in the first place.

You may, or may not, have seen my scathing attack on '95 a bit back so
I feel obliged to say I like NT, but the omission of some system
utility to accomplish this is quite scandalous, and if it does exist,
why is it so darn hard to find!

>Someone came up with a solution for Windows 95, however, perhaps this also
>applies to Windows NT.

Yes, I'll be looking into it. Maybe I've been lucky, I've found NT
runs most of the '95 stuff I've got or downloaded, contrary to what is
generally said. Fingers crossed, it'll work! :-)

I do plan on installing it although I hoped to put it off a bit, while
I 'migrate' essential apps from '95 to NT. Looks like my plans are

going to have to change!

Thanks very much. I'm glad so many people seem to like POPwatch :)

I use the 'reject' feature an awful lot now. I just seem to be getting
stacks of junk email lately. So far I haven't had a repeat of email from any
that I've 'rejected'. Maybe it works, maybe it's just coincidence. Either
way, it makes me feel better being able to 'bounce' their junk :)

>I've saved my Kill File log from 2.22, will the new version see that
>and send failed DNS messages when I next receive something from one of
>these sources?

No problem. If you've set POPwatch to automatically 'reject' killed email,
that should work fine.

>Also, I've seen a couple of posts where you have been testing
>something called News Hound. Am I right in surmising that you are
>developing a Mail/News reader? Can't wait.

News Hound has now been renamed NEWSwatch and is still in beta ATM.
It's not a full email/news client. It does a similar thing to POPwatch
in that it sends and receives news articles via STiK, using Oasis1.3x/Snews
or Oasis2 as the editor/viewer.

I am planning on writing a full email/news client, but it's difficult to
find the time ATM :(

Regards,
Gary

I'm hoping to use my trusty Atari to hook into my companies network, just as
soon as STiNG works with PPP on my Falcon. The network is extremely complex
and has many different types of machine (Unix, AS/400's, PCs, etc.).
To telnet properly to the Unix boxes I need VT220. 102 just doesn't cut it.
Don't ask me why, it's just so. I've tried 102 etc. under Windows95.
I don't know too much about telnet, so I don't really know the differences.

> Unless I am wrong, Peter isn't looking to write a new Telnet, since

>description of the way each of the control codes works and I'll fix TelVT102!!
>That would seem to make more sense, since the framework is already there.

I wouldn't even know where to start looking :(I take it they're not defined
in the usual RFC's?

>Or don't you like TelVT102, and why???

I've used it a few times for changing my ISP password etc. Once I get STiNG
working, I will be trying to use it a lot more (as I said above). So I guess
then I'll see what changes I'd like to see.

For now, I'd like to see some sort of hotlist function. Or at least the
ability to paste into the relevant dialog box (mentioned this to you ages
ago in the STiK list, dunno if you've done it yet though?).

Secondly, I'd like more 'Cancel' buttons in all the dialogs. At present, if
you take an option you end up commited to it. Not very user friendly.

Well, you did ask :)

Regards,
Gary

Neither do I. The only thing I do know is that Workstation has some server functionality - enough to serve remote users accessing shared resources. As one of the 3 protocols allowed is TCP/IP then even if there isn't any 'routing', the two machines should be able to talk to each other.

The only other solution which is available is probably the better one, to install a network adapter as it fits the scmeme of things better. I tried this, hoping for (what to me is obvious - perhaps I've not been at this long enough!) a generic adapter. That is, the bit of NT which microsoft wrote, which is simply a driver, obtaining its input from some standard device on a PC, specified by the user. No such beastie!

There is some sort of loopback adapter I saw mentioned over the
weekend. From the little I picked up, this appears to be some method
of making a standalone workstation think it really is attached to a
network. Any idea if this is worth investigating further?

>>Bearing in mind I've only had NT installed for a few days there seems

Well, to be fair, it does make more sense to have a "dummy" adapter.
It's only when I didn't find one that I tried the install modem
option.

>simple solution is to wipe NT and install linux <G>

I'm very tempted as there seems to be no immediate solution. The most
annoying thing is there's a 33K modem inside the PC which is dead
weight under NT. If only there were a driver for it I could connect it
back to back with the Supra on the ST.

>Or to use the ST to do the masquerading... but then what would you
>plug the pc into...

[no comment - can't think of anything which isn't rude] :-))

On the subject of unix, what do I need to consider? re: the ultra-ata
controller for instance.

3407. Disk Image Maker For Emulator - Any Alternatives?

Newsgroup: comp.sys.atari.st
Date: 1997-09-15 00:00:00 UTC
From: bmdman@spamhead.netkonect.co.uk
Message-ID: <5vkag7avg1@infoserv.netkonect.net>
Source record: 116930

I am using "imgbuild" to copy my Atari disks into .st disk images. Unfortunately it does not copy a lot of my programs. Are there any alternative utilities for doing this, or am I going to have to miss out on some of those classics that won't copy? Or perhaps it's me....? Some advice would be appreciated. Thank you. Alan.

>'can't load config'.

Have you got a file called STIK_DIR.DAT lurking around somewhere,
usually the root of the boot drive? If you have, use a text editor to
point it to the path where the config files are - don't forget the
trailing backslash. If you haven't got one, create one, and do the
above. STIK_DIR.DAT must reside in the "current" directory when STiK
loads. Typically, this is A:\ or C:\ but utilities can sometimes alter
this.

> I've tried several RAMdisk jobbies and
>STiK doesn't like any of 'em! I've tried RDE, Maxidisk and TrueDisk

When STIK_DIR.DAT does not exist, STiK looks in the current directory
for its config files. Thus, if you create a reset proof bootable ram
disk and install STiK there it should work. I've never tried it but it
should.

If we're talking executable code here then there's not even a PC
version, at least not with the archive I got! However, if memory
serves, the C source looked pretty portable and would only need
changes to the header files and possibly one or two macro redefinition
"hacks" to compile.

Er, sometimes I wonder where my brain disappears to! Just compress
them as multipart mime or uu-encoded docs. Gawd, why didn't I think of
that in the first place. ;-)

MK> ever and have got it up and running in less than 10 minutes.

I can't agree completly with you. I have just upgraded Cab from v2 to v2.5.
Cab is much much better, you're right. But PPP-Connect is not so easy to
setup. It is probably ok along with Magic. With MiNT there are some problems.

BTW, multitasking is more than recommended to be able to use the power of
Cab, especially for the fabulous CAB'odules :-)

The best way for me is MintNet + GlueStik + ovl 1.2618, or MintNet + ovl
1.81. I'm glad with those combo.

In an other message you say Cab is the same price than before but that's
wrong. Just see at the ASH info pages...

And what a great program it is too. Thanks Gary, for writing such a straightforward, easy to set up program that just does what it is supposed to, with no fuss. I've yet to use the new "reject" feature, but I am eagerly looking forward to it, as the Calgary Freenet seems to be an email spam magnet.

I've saved my Kill File log from 2.22, will the new version see that and send failed DNS messages when I next receive something from one of these sources?

Also, I've seen a couple of posts where you have been testing something called News Hound. Am I right in surmising that you are developing a Mail/News reader? Can't wait.

Thanks again for the program.

I wish I could be more specific but it looks as though the PCB RAM is
still getting the CAS signal (as well as the additional DRAM). When
all is set up OK the PCB RAM should no longer be addressed just the 2
2Mb banks on the expansion board.

Are there any jumpers which may cause PCB RAM to be ignored?

It sure exists ! It is a very unreliable and unsteady crack of the first Mac-emulator David Small made. Yoy need the program and then a system disk with System and Finder from years back to get it to work. The disk need to be in a special format as well.Not seen this emulator for a while (say 8-10 years).

3424. Papyrus 5 - purchase decision

Newsgroup: comp.sys.atari.st
Date: 1997-09-16 00:00:00 UTC
From: Alyre Chiasson <alyre.chiasson@fundp.ac.be>
Message-ID: <341EEC0B.1ECCD@fundp.ac.be>
Source record: 116742

Hello,

I get frequent requests to submit files in either Word or Wordperfect format and often I have to do the reverse that is read files in Word or Wordperfect. What I am currently doing is using That's Write and the utility by Robert Best to convert to WP 6 and TW. For simple text the conversion is excellent. However, That's Write is a trial in patience with frequent freezes, crashes, a distaste for text longer then 10 pages and loss of time. How does Papyrus 5.0 compare in stability and what does it have as import and export features, how severe is the loss of format information in the conversion?

Is it worth the purchase compared to what I am using now?

Thanks

Alyre Chiasson

3425. WANTED:That's Write 3 / Speedo Print drivers

Newsgroup: comp.sys.atari.st
Date: 1997-09-16 00:00:00 UTC

Called COMPO USA today and found their offices closed. Hope they are not out of business!

Anyone have a printer driver for a Canon BJC-240 or BJC-250L or Epson LQ-510? SpeedoGdos v5 or That's Write v3 required. If these aren't available, could someone tell me what drivers are available for low-end ink jet printers?

Two problems:

1) CAB 2.5 is not yet available in England, whatever ASH say about it.

2) You can't collect e-mail or news, or do ftp, telnet, or irc with ppp-connect, atm. CAB is the *only* compatible program.

> appreciated. Thank you. Alan.

I am assuming you are talking about "copy protected" games disks...and as
the phraser says, you can't copy them at all.

It's mostly the weird disk formatting they used where you have to load a
normal TOS program in the boot sector that tells the ST "how" to read the
disk. And since it mostly requires the special floppy disk controller in
the ST, you definitly cannot just read it off a PC drive.

I really wish this problem would be solved as I would like to keep playing
my favorite games. :(

Hi Roy

System Solutions are currently shipping MagiC 5.13 (that's what I run).
I have no idea where you got your copy of MagiC from, but I'm sure if you
return the original disks to Sys Sol, they'll upgrade you. The price is 5
UKP I seem to remember. And yes it is English!!

Well, we Demon users have one. It's called demon.ip.support.atari. But of course that's just for Demon users :)

>And are you sure that it CAB/PPP-Connect hasn't been released?
>System Solutions had a big ad about it in the last issue of Atari

>for them as ther are both swedish and french resource files available.

It most definately is *not* released yet. I ordered it from System Solutions about a week ago, to be told it wouldn't be released for another two weeks. Now, I *know* what Sys Sol estimates are like, and I don't expect to get my copy of 2.5/PPP Connect for another month or so, realistcally! I just hope they don't charge my credit card until it's ready.

I'm not too bothered by CAB, as I get all the latest betas <g>. But I am interested in PPP-Connect. I'd like to see it, to see if it's worth porting POPwatch and NEWSwatch to run with it as well as STiK!

It DOES work. I use the latest TrueDisk from Joe Connor's page
setup as Drive M:\ for 2 Mb on my machine. However, Al should
really upgrade his STE to its full 4 Mb capacity.

Otherwise, it will not work, since CAB 2.0 requires about 2 Mb
itself and CAB 2.5c (with all the modules loaded) nearly 3 Mb.

Start the external editor before sending mail. NEWSie will detect
that the editor is already active, and send a VA_START to the editor.

If it accepts the VA_START, the editor will open a new window with the
selected file. When you save and close the editor window, NEWSie will
continue by putting up the Send dialog.

The editor will remain active for the next mail, etc.

Hope this helps,
John

> at work, and an Atari at home!

This sounds like the best option for me so far - what most folks who are doing the recommending don't seem to realize is that the files are *on* the Mac hard drive right now - so I need to run a program on the Mac to segment them onto Atari ST recognizable floppies, then have the Atari be able to rejoin them. I can also run DOS, Win3.1, and Win95 programs on the Mac too, so any of them is OK.

Any idea where I might find Megaflim? (Or is it really MegaFILM? :)

Oh, there's also a GEM emulator on the Mac called MagiCMac, I might be able to use that somehow with some of the other Atari-only programs! Hmmm... have to check into that. Thanks for everyone's help! - Bob

They have been gone for at least a year - maybe more, my memory fails
me -

> Anyone have a printer driver for a Canon BJC-240 or BJC-250L or Epson
> LQ-510? SpeedoGdos v5 or That's Write v3 required. If these aren't
> available, could someone tell me what drivers are available for low-end
> ink jet printers?

Depends on what kind of printer you have. Mamy 'low end' or older
Inkjets have dip switches for Epson or IBM proprinter emulation and
TW3 has a good many drivers included. The HP DJ5 driver on Speedo
works fine on my HP600 - at least for printing text from 'Steno' and
'StraightFax' and I got a HP600 driver for Pagestream from source on
the net.

Too bad tho' that Compo went west - TW3 is one of the best WP packages
around IMNTBHO !!!

It's just been announced that AtariFolk will be welcomed in The Computer Club Forum (GO CLUB) on CIS. There are separate library and message sections for 8 bit and 16 bit Atari Computers, so all of us can feel at home.

I've been poking around "The Club" for a couple of weeks now, and can say that these seem to be our kind of folks"... they're hospitable, understanding, easy-going, and most of all... they're orphans just like us! <g>

See ya there,

Joe Mirando @ STReport

3446. Tos images (not for an em

From: Keith.Turner-cairns@rebel.ronly.org
Message-ID: <2bc_9709151953@ronly.org>
Source record: 116764

"Stephen Barrett" bragged to All:

"B> Is it possible to use a tos image from one Atari (v2.06) on another Atari.

"B> I know that the early St's used a disk based tos and I was wondering if it
"B> is possible to load the new tos vesion on top of the old from disk. I have
"B> tried using an auto folder (some chance ;-)) without success. Any help
"B> will be greatly appreciated.

Yes it's quite possible, but it needs a short piece of code to install the TOS
instead of the ROM TOS. The source is out there somewhere! I've seen it years
ago, If I find it, I'll upload it to Sys-op.

cheers

1040STfm with 2.5, SC1224 color monitor, oodles of software (most of it dated). I want to dump this thing; I'm not using it. For 2 years it was the heartbeat of a Mid production studio - it has fallen victim of a PC world. I won't refuse any reasonable offers. It is a complete and working sys at the very least. I know that some of you guys snag these things for parts... I don't care what you want it for.... just make a reasonable offer to wmarkw@aol.com. Considerations for shipping and/or international duties will be made and the easiest sale gets it.

>money.

What about the compulsory recoding of Latin 1 characters into the Atari
standard? I need an option to shut that off since I need _all_ characters
in Latin 1. (Those lacking in the Atari standard are now shown as a
question mark.) The recoding is a pain in whatever since I have fonts that
are in Latin 1.

There are IDE controllers for ST series available, atleast there have been,
but the 1Gb limit might be a problem. The IDE controller itself is a bit
tricky to install, as you need to desolder your CPU and a lot of extra
work to be done. The controllers I've seen (Hard&Soft - Germany) are
desgined so that you will get an internal drive :-/

Hi Al!

Al Ferrier wrote:

> 'can't load config'. I've tried several RAMdisk jobbies and
> STiK doesn't like any of 'em! I've tried RDE, Maxidisk and TrueDisk

I have a 4Mb STe with no harddrive, and I use maxidisk. I have used it with STiK and now I use it with Sting. I use a program that copies the necessary files to the ramdisk at startup i.e. stik/sting files (what's in the stik_cfg directory basically). Then you have to create a file called stikdir.dat (for STiK, I don't remember what it's called in sting) that tells STiK where to look for the files (it's in the manual...). What I also do is to copy the GDOS fonts i use to the ramdisk to speed things up (be sure to edit your assign.sys though), and I put an editor there aswell (for writing email etc.). Then it should just be a matter of telling CAB where everything is/should be. Don't forget to put stuff in the right order in your auto directory. It should be something like this:

maxidisk
raminit (the program that copies the files)
hsmodem
stik/sting
gdos

Since you only have 2Mb memory you should probably not use too many fonts or too big cache. A ramdisk of 500Kb should suffice.

Happy surfing.

: I need to change the driver for NVDI to allow this to work :-(

: The 400 seems to be different than the other Epson Stylus printers :-(

I would be pleased even if I could only print at 360 DPI, but until now I understood that none of the supplied NVDI drivers would work with the Stylus 400 at all. (I haven't actually tried any though.)

So please tell me, if I am understanding you right you can print at 360 DPI, just not 720 DPI? Which driver did you use to do this?

I believe someone said a short while ago in this newsgroup that a driver for the Stylus 400 was being made just now (at 730 DPI). Hopefully this will become available soon.

3461. ATARI-ST emulation, GEMUL8R.INI

Newsgroup: comp.sys.atari.st
Date: 1997-09-16 00:00:00 UTC
From: Rolf Hemmerling <hemmerling@geocities.com>
Message-ID: <341E5B36.88FAC33A@geocities.com>
Source record: 116862
Cross-posted to: comp.emulators.misc,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy,de.comp.sys.st,fr.comp.sys.atari,maus.sys.atari.hardware,maus.sys.atari.talk,maus.midi,fido.ger.atari,comp.emulators.misc

In english:
I am looking for tools (and docs) for the free ATARI-ST emulation "GEMULATOR CLASSIC" version 3.6. Especially a configuration software for the GEMUL8R.INI file and infos about the options, any tools to create virtual disk image files, infos how I may include a plain MSDOS drive (2 GByte MSDOS partition on my big PC) for GEMUL8R.., the special keyboard functions mapping, maybe from an earlier demo version (the current free version just consists of the GEMUL8R.EXE file.

I still need the software program to generate the virtual disks (and to copy to and from them), and any configuration option, infos and software for partitioning harddisks to include a plain drive (C: as C:). My MSDOS partition is 2 GByte (and there is a hint in the online infos, that a plus for the GEMULATOR 96 is the "Support for very large hard disk partitions, CD-ROMs, and network drive" and "Earlier versions of Gemulator required setting up separate Atari ST hard disk partitions, and while this is still an option it is no longer required.". So probably I don't have true harddisk support on my big PC on my MSDOS partition !

I got two GEMUL8R.INI files from a friendly newsgroup readers, but.. if You got another rather-complete "big" GEMUL8R.INI file with comments.. I wuold be interested in it, still.

Please answer me personally too !

Auf Deutsch:
Ich suche noch Hilfsprogramme (und Dokumentation) f&#65533;r die freie ATARI-ST Emulation "GEMULATOR CLASSIC" Version 3.6. Besonders Konfigurations-Software f&#65533;r die Datei GEMUL8R.INI und Infos &#65533;ber die Optionen, irgendwelche Programme zum Generieren von virtuellen Disk-Image Dateien f&#65533;r GEMUL8R, Infos wie ich reine MSDOS Laufwerke einf&#65533;ge (2 GByte MSDOS Partition auf meinem gro&#65533;en PC), die Tastaturbelegung f&#65533;r spezielle Funktionen.. vielleicht von einer fr&#65533;heren Demo-Version (die aktuelle freie Version besteht nur aus der Datei GEMUL8R.EXE).

Ich brauche noch das Software-Programm um die virtuellen Disks zu generieren (und von und auf sie zu kopieren), und irgendwelche Konfigurationsoptionen, Infos und Partitionier-Programme um ganze Laufwerke einzuf&#65533;gen (C: als C:). Meine MSDOS Partition ist 2 GByte (und es war ein Hinweis in den Online-Infos, da&#65533; einer der Pluspunkte f&#65533;r den GEMULATOR 96 ist "Support for very large hard disk partitions, CD-ROMs,

and network drive" und "Earlier versions of Gemulator required setting up separate Atari ST hard disk partitions, and while this is still an option it is no longer required."). So habe ich wahrscheinlich keine wahre Harddisk-Unterst�tzung auf meinem gro�en PC auf meiner MSDOS Partition !

Ich habe zwei GEMUL8R.INI Dateien von zwei freundlichen Newsgroup-Lesern erhalten, aber.. wenn Ihr noch eine ziemlich-komplette, kommentierte, "gro�e" GEMUL8R.INI habt.. h�tte ich immer noch Interesse.

Bitte antwortet mir auf jeden Fall auch pers�nlich !

Tschau / Sincerely
Rolf

From: Alan Swanson <emdu02@holyrood.ed.ac.uk>
Message-ID: <341E6D6D.5357@holyrood.ed.ac.uk>
Source record: 116864

While recently setting up my STE I noticed that Magic 5.1 is setting up the _FRB cookie. This is the alternative/fast ram buffer I presume for the TT. Does anyone know if there is a way to get rid of it because its allegedly taking up 64kB of space. Okay, So I've got a 4MB STE but 64k is 64k and I hate wasted memory.

I thought it might ber something in the MAGX.INF file, but I don't see anything that would do this.

Any help appreciated.

ALaN.

> accepted by GEMULATOR CLASSIC, as I may see if I change a parameter for
> the RAM size. But: The sender of this initialisation file did not know
> exactly the syntax of the parameter to let the GEMULATOR CLASSIC take a
> TOS.IMG file and to avoid the scan of the ports.

I read the last postings in this thread and could not resist to try it
out myself. The posted ini-file worked fine after I changed the name of
the TOS-Image (I put the TOS-Image in the same directory as the
Gemulator so there was no need to specify a pathname). Gemulators
starts, reads the ini-file, scans the port (don't know how to avoid
this) and then runs with the TOS from the file!
Now this is where the problems start when working under Windows NT.
Gemulator tries to access the disk and the COM-Ports directly which is
blocked by NT. It also tends to "hang" after a while.

3467. NEW FALCON FANTASY GAME!!

Newsgroup: comp.sys.atari.st
Date: 1997-09-16 00:00:00 UTC
From: d92jk@efd.lth.se
Message-ID: <5vlv0g$d9m$1@news.lth.se>
Source record: 116868

Conquest of Eysium II has been released. Take a look
at http://www.efd.lth.se/~d92jk/coe.html and check
out the demo version.

Fantasy Game

Conquest of Elysium is a fantasy game for the Atari Falcon. You and your friends take control of a
powerful warlord or wizard and struggle for total control of the continent. Up to eight players may
participate and the computer can control any free players.

The Characters

There are seventeen different character classes to choose from, everyone has different strengths and
weaknesses. E.g. the barbarian has lots of powerful men but they do not have the technology to build
war engines and are very vulenrable to magic. The demonologist collects human sacrifices and uses
them to bind the demons he can summon. If he uses too few sacrifices the demons may get out of
control and attack their summoner (and demons are very powerful indeed). The Enchanter has the
ability to animate non-living things, the resources needed for this varies from a silver sword for the
creation of a living sword to a complete mine for the creation of a powerful iron golem. The
Necromancer can raise the dead to join his army of undeads, but he will become more and more
insane with every attempt to do so.

There are about three hundred different kind of monsters in the game, so it will probably take a year
or three before you have seen them all!

Tech Info

The game runs in true colour and requires 4 megs of memory. You also need a colour monitor (both
rgb and vga will do) or a tv. It takes advantage of virtual memory and will run nicely under multitos
without shutting off the other programs.

So why buy an expensive HD then? You can fit a regular sized HD (3.5"?)
as well if
you squees a bit. I think there are textfiles telling you how to do it
and what
is needed.

Okey, okey, it's just that it starts to get a bit annoying reading
all these messages about networking problems. A newsgroup set up for
this stuff would be great as it's ssssoooo much of it.

comp.sys.atari.internet would be usefull IMHO.

And are you sure that it CAB/PPP-Connect hasn't been released?
System Solutions had a big ad about it in the last issue of Atari
Computing. Also I bet that there must be translated resource files
for them as ther are both swedish and french resource files available.

3471. Re: Memory Prob 1040STFM HELP!

Newsgroup: comp.sys.atari.st
Date: 1997-09-16 00:00:00 UTC
From: denr@denr.demon.co.uk
Message-ID: <874423438_OASIS_@denr.demon.co.uk>
Source record: 116872

Thanks to Gerry O'RourkeI now know that:

I actually have an Atari 1040STFM with a Power Computing (allegedly made by Gasteiner) 4meg upgrade board containing four 1meg 4bit DRAMS which give me a total RAM of about 2.5meg.

The upgrade board is fitted over the shifter and has space for four more DRAMS.

I obtained and fitted four more compatible 1meg 4bit DRAMS however when I attempt to start up, with hard disk, or floppy boot disk, or no disk; all I get is a Twenty bomb display.

What to I need to do to correct this matter??

All and any advice gratefully accepted.

I am using a Janus card in my machine. I found OS/2 to be much better
for this purpose. Just wanted to mention how I solved this problem.

I just assume Gemulator will run fine under OS/2 (or Windows 95) as
well.

Have fun.

3474. WTB: Monitor for Falcon

Newsgroup: comp.sys.atari.st
Date: 1997-09-16 00:00:00 UTC
From: Nicole L Hammond <nicoleh@U.Arizona.EDU>
Message-ID: <Pine.A41.3.96.970916092412.62804A-100000@aruba.u.arizona.edu>
Source record: 116875

Hello!

I am looking for anyone willing to part with a monitor capable of syncing to all of the Falcon's mode rates (i.e. down to about 15kHz H-sync rate) for a decent price. Someone last week had a Mitsubishi monitor for $65 US, but never responded to my e-mail. If that person reads this and still has it and still wants to sell it, please let me know! Thanks!

So I'm one of the few who didn't succeeded to use PPP-connect. Not
that I've try hard. I've a working MiNT/MiNTnet setup so why breaking
my brains!!
I could make a connection with my ISP but Cab seemed not to interact
with PPP-Connect although I was using the special cab.ovl. Furthermore
if I recalls me right my system crashed after a while.

CAB 2.50 is much better indeed.

If there comes more applications which work with PP_connect then maybe
I could give it a new try but right now for me it's of no use at all.

Pete, its a self oscillating Chopper PSU design.

Your applying the meter seems to kick it off into its self oscillating state.

Its normally kick started with a capacitor fed AC voltage fed from the bridge
rectifier, then natural oscillation takes over.

Personaly i'd change all the Low voltage Electrolytics caps and expect a
result.

> business on Pc & Psx & co) mind if somebody spread 5 years old
> games????? do you????? i don't.

What about people who have the original games and that might be trying to sell them second hand ? That pirate stuff is stealing them the value of their software. I'm sorry to bring you off of your cloud, but some people still value their software even 5 years after.

And it's not just because nobody 'cares' that crime is ok. Do you drive through red lights just because there's no cop around ? Our society has a number of rules that you're supposed to follow. If you don't, then don't be surprised if everyone thinks your an asshole!

If you want the last people who might be trying to make some money by developing software for our platform to be pissed off at piracy on this newsgroup then go ahead. If you want developers to be confident in the good spirit that exists around here, then go away.

Nick

3486. CAPTAIN BLOOD

Newsgroup: comp.sys.atari.st
Date: 1997-09-17 00:00:00 UTC
From: exxos@netcomuk.co.uk
Message-ID: <341F3A50.5276@netcomuk.co.uk>
Source record: 116768

Hi,
Perhaps this isn't the right place to post this - I don't know...
Anyway, I'm trying to find a copy of "Captain Blood" - I've got a PC,
so I have to use an emulator. I have found an unsatisfactory copy of the
game, on a disk called "auto077", which is kind of a dodgy hack. I
really need a copy that works properly! (The game clock is the main
problem in this version...)
Can anyone help me? I do have an original Atari ST copy on disk, but
I haven't tried to transfer it to the PC, because I know there will be
problems with the on-disk copy protection.
So if anyone can send me a good copy, or tell me where to get one, or
help me with a workaround for the copy protection, I would be very
grateful!

Thanks!
-Sam Jeffreys <exxos@netcomuk.co.uk>

3487. Need help w/MG-FTP please

Newsgroup: comp.sys.atari.st
Date: 1997-09-17 00:00:00 UTC
From: tross3@hamtel.tds.net
Message-ID: <5vnjkt$1h7@news2.tds.net>
Source record: 116769

Anyone out there use MG-FTP?

I downloaded Version 1.40 because it supports the PORT command, which I needed because GeoCities won't accept a PASV upload - now I've got yet another problem.

Nowhere in what documentation there is does it say how to switch modes. It goes into binary mode, and stays there. I've tried all sorts of key combinations with no results. So, I'm at the point where I can upload GIFs and things of that nature, but no HTML files (although I did get one up once, out of about 120 tries... I have no idea how).

Anyone know how to tell it to switch modes?

Thanks,
Terry

MagiC Mac an emulator? hehehehehehehe:). GEM emulator? ROTFLMAO:).
errr, ummm, sorry:).
If you do try it, there is a 99% chance that you won't be using the Mac O/S
any longer:).It is a sizeable investment, but if you did purchase MagiC Mac,
you can connect your AHDI compatible hard disk (zip,syquest,ect) to the Mac
SCSI bus. When you start MagiC Mac, it will automatically recognize the Atari drive
and read it under MagiC. Mac folders are assignable and available to MagiC Mac,
so all you would have to do is drag the file to your Atari harddisk and connect it
back to your Atari machine, much like your virtual PC apps are setup (btw, I don't
know if VPC can read/write PC hard disk:). Actually, with a little effort, MagiC Mac
will recognize PC formatted hard disk (you have to play with this one). So if you
wanted to transfer Atari files to a PC hard disk, you could do it the same way as
the above mentioned method with AHDI drives.

It's all in the handbook. Move on. (Bettlejuice).

Mike

3491. ATARI-ST emulation, GEMUL8R.INI

Newsgroup: comp.sys.atari.st
Date: 1997-09-17 00:00:00 UTC
From: Rolf Hemmerling <hemmerling@geocities.com>
Message-ID: <341F833C.648C0BB9@geocities.com>
Source record: 116773
Cross-posted to: comp.emulators.misc,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy,de.comp.sys.st,fr.comp.sys.atari,maus.sys.atari.hardware,maus.sys.atari.talk,maus.midi,fido.ger.atari,comp.emulators.misc

In english:
I got now the free ATARI-ST emulation "GEMULATOR CLASSIC" version 3.6
up and running, see report with tricks and tips on my ATARI homepage
http://home.pages.de/~h/atari.html

One last question:
The only way to copy from and to virtual disks of GEMULATOR classic is
either running GEMULATOR CLASSIC and copying to and from floppy disk or
running the later, not latest GEMULATOR 96 V4.5 demo and copying to and
from the real MSDOS harddisk partititon (even if this partition has a
size of 2 GByte, as it is usual today)

So please users/buyers of GEMULATOR CLASSIC, what is the maximum
partition size of MSDOS partitions that GEMULATOR classic can handle
for direct disk access ? Is there a 32 MB partition limit of ATARI-TOS
for MSDOS partitions ?

Please answer me personally too !

Auf Deutsch:
Ich habe die freie ATARI-ST Emulation "GEMULATOR CLASSIC" Version 3.6
nun zum Laufen bekommen, siehe meinen Bericht mit Tricks und Tips auf
meiner ATARI Homepage
http://home.pages.de/~h/atari.html

Eine letzte Frage:
Die einzige Art und Weise, wie man auf die und von den virtuellen
Harddisks kopiert ist, entweder GEMULATOR CLASSIC laufen lassen und
�ber Floppies zu kopieren, oder die neuere (aber nicht neueste)
GEMULATOR 96 V4.5 Demo laufen zu lassen, und dort dann auf und von der
realen MSDOS Partition zu kopieren.

So liebe Nutzer/K�ufer von GEMULATOR CLASSIC, was ist die maximale
Partitionsgr��e von MSDOS Partitionen, mit denen GEMULATOR CLASSIC
zum direkten Dateizugriff umgehen kann ? Gibt es das 32 MByte Limit
von ATARI-TOS f�r MSDOS-Partitionen ?

Bitte antwortet mir auf jeden Fall auch pers�nlich !

Tschau / Sincerely
Rolf

for your information fuzion cd's are more than 4 years old, so i don't
think that editors of the games on theses disks think to make money with
the atari st in 1997.

for your information, i never asked for any NEWS here, and i will never
do. because i respect the work of the lasts editors on st... this is not
the same thing for me.

that's all

i hope my english is understandable :)

3495. RAMdisks & STiK/CAB:soultion?

Newsgroup: comp.sys.atari.st
Date: 1997-09-17 00:00:00 UTC
From: sonik@zetnet.co.uk
Message-ID: <5vohne$20r$1@roch.zetnet.co.uk>
Source record: 116777

Dear fellow Atarians

Many thanks for all the help I received from
some subscribers to this NG re my problems with
CAB,STiK and Ramdisks. I believe that this has
now been resolved.

For the record, anyone out there who wants to see
a decent speed improvement in CAB's WWWCache folder
access could do worse than put something like Maxidisk
in their auto folder (after STIKSTR.PRG and HSModem)
and redirect cache data to the new partition. It's
also useful with Newsie as somewhere to put your e-mail
editor (Everest, etc) and your mail folder(s), though
if you intend to read your mail offline at a later date,
it may be a good idea to copy the files back to a floppy
before powering down.

It's early doors, but I will monitor my phone bills to
see if this makes a significant reduction to online costs!
One day, I'd like to see an ISP with a freefone 0800 log-on
number, something which would make the Net (and that ISP)
VERY popular and reduce ongoing costs to just the cost
of the subscription rate to that ISP. Radical? Maybe, but
I think someone should take the plunge. If the Net is to
be the new mass medium, this could be a significat first step.

Cheers again

Al Ferrier /|\

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 09/17/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped!]:
$ 5.50 Arkanoid (Taito)
$ 5.00 Art & Film Director (Epyx) -- $4 shipping, due to weight,
counts as 1st item
$ 2.00 Bobo (Infogrames / Terrific Software)
$ 7.50 Bubble Bobble (Taito)
$ 4.00 California Games (Epyx)
$ 4.00 Championship Wrestling (Epyx)
$ 4.00 Death Sword (Epyx)
$ 3.00 Devon Aire (Epyx)
$ 2.00 Dragon Scape (Free Spirit)
$ 3.00 Final Assault (Epyx)
$ 4.00 GFL Football (Gamestar)
$ 3.00 Golden Path (Firebird)
$ 3.00 Goldrunner II (MicroDeal)
$ 4.00 Impossible Mission 2 (Epyx)
$ 4.00 Karateka (Br0derbund)
$ 3.00 Knight Orc (Rainbird)
$ 3.00 Lands of Havoc (Antic Software)
$ 4.00 Man Hunter: New York (Sierra)
$ 2.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 4.00 Metro Cross (U.S. Gold / Epyx)

$ 4.00 Paint Pro (Abacus Software)
$ 3.00 Prime Time (First Row)
$ 4.00 Quadralien (Spinnaker)
$ 4.00 Renegade (Taito)
$ 4.00 Space Quest: Chapter I (Sierra)
$ 3.50 Stunt Track Racer (Microplay)
$ 3.00 SwiftaR (Accustar)
$ 4.00 Techno Cop (U.S. Gold / Epyx)
$ 4.00 The Advanced OCP Art Studio (Rainbird)
$ 5.00 Warship (Strategic Simulations, Inc.)
$ 4.00 Winter Games (Epyx)
$ 4.00 World Games (Epyx)
$ 4.00 World Karate Championship (Epyx)

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3 for the first game and $1.25 for each additional game, unless otherwise listed. If you order enough items I can weigh the order as a package, which might reduce the shipping costs. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth

what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your
order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address
(this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

3498. TT clock problem

Newsgroup: comp.sys.atari.st
Date: 1997-09-17 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5vooam$o5v@alexander.INS.CWRU.Edu>
Source record: 116780

I am having a peculiar problem with my TT clock. Every once in a
while, when I reboot, the clock year shows up as '92 instead of '97. I
changed the battery, and it still does it. I have a real time clock on my ICD
SCSI adapter, but I get bombs when I try to run GETTIME.PRG in th auto folder.
And the ICD has a new battery in it, too.
The only thing it does wrong is thwe year! the date and time
still come up right. Well, almost right. It seems to lose about 5
minutes every time this happens.
Anyone have any ideas???

From: Michael Clemmetsen <michael.clemmetsen@sunderland.ac.uk>
Message-ID: <341FF0CE.893F2A30@sunderland.ac.uk>
Source record: 116781

Hi Alyre,

Papyrus 5 has much improved RTF (rich text format) import and export. This means that you can exchange documents containing tables with MS Word. I'm not sure about WP6 as I don't use it, but I've found it to be pretty accurate with Word. You can try before you buy by downloading the english language demo from Hisoft: http://www.hisoft.co.uk/papyrus/ the demo itself is at http://www.hisoft.co.uk/download/papdemo.tos . This is a self extracting archive. Note you will need a later version of Speedo GDOS or NVDI a hard disk and 2MB of memory to make the most of Papyrus. When I bought my copy from HiSoft I got version 3.66 and the 3.66 manual plus version 5 upgrade disks and a version 5 addendum to the manual - this means that it takes a while to learn all the features as the menus have changed since verison 3.66 and this is not accurately covered in the addendum. However all the concepts are covered between the two manuals - they are well worth reading if you want to get the most out of the program. But then who reads manuals?!

Alyre Chiasson wrote:
> How does Papyrus 5.0 compare in stability and

*** My original high bidder has evaporated, so...please, only serious bidders respond. Thanks! ***

I recently acquired this hardware, and to be honest, "my eyes were bigger than my stomach" (i.e. not enough room). In fact, I'm going to off-load some CBM stuff as well shortly. These Atari items were gathering dust, so a good cleaning in and out would be in order. I have no manuals, software, or original boxes, just the hardware. In any case, here is what I have for sale:

Atari 520ST w/PS
Able to get it to boot up into the GEM desktop (no mouse to use) and using the alt-arrows able to move around a bit. Seems to be working fine. Not sure what TOS version, as all it said was TOS.

Atari SF354 w/PS and connecting cable
No diskettes to test with, but whirs, clicks, etc. when booting the ST. Looks good...but buyer beware since I cannot test it adequately.

Atari SM124
Seems to work fine and looks good. Just a hint of a picture "wobble" at left corner. Didn't seem to be annoying...but thought it worth mentioning.

It does not matter to me whether these go as bundle or parceled out individually. Buyer will be responsible for shipping, so keep in mind that your offer should be in the form of $$$+shp. I'm willing to ship USPS or UPS your choice. I'll take offers for about a week or so.

Location of items is: Houston, TX.
Send offers/questions to: dennis_cooper@administaff.com

3502. Printing with Papyrus 5....again! :)

Newsgroup: comp.sys.atari.st

Hi All,

Once again I seek help with printing colour pictures with Papyrus 5 :)

I've upgraded to NVDI version 4.11 installed it and ran Papyrus 5.
Everything seems to be fine when printing but here's the funny
thing,all I get is any text in the document printed and still no
pictures!

I've fiddled with the settings and the best results I've had so far are
text printed as normal and no pictures or just a coloured mess and
nothing else!

What am I doing wrong??!! Please could someone give me an idiots guide
to printing colour pictures from Papyrus 5? :)
What paths should point to what,settings in the dialog boxes that sort
of thing?

My setup is a Falcon 030,14 meg RAM,NVDI v4.11,Papyrus v
5.11,SpeedoGDOS v 5.00.

Thanks once again to anyone who can help!

Nostrodamus phrophesised this from Peter to bob.shuster@webphoria.com...

Hi Peter!

PW> In a message of <13.09.97>, bob.shuster@webphoria.com (90:102/0.99)
PW> writes:
bs>> Is there some compression program that will allow one to segment
bs>> files ("split" files) across several floppies?
PW>
PW> Yes SPLITTER.PRG together with SPLITTER.TTP will do this (the former
PW> is a GEM shell for the latter). This was on an /Atari ST User/ cover

Unfortunately this prog doesn't work well on newer PCs, it needs to be
recompiled for 486 etc processors, this version will only split into tiny
sections which effectively renders it useless, sadly.

Message-ID: <1383_DCroker@fortress.org.uk>
Source record: 116789

Nostrodamus phrophesised this from lmartin@midamer.net to All...

Hi Tony!

l>
l>
l> Is there a way to wire a connection to allow you to plug an IBM pc
l> keyboard into the ST wiring so you can use a good pc keyboard instead
l> of the lame feeling ST one ???
Look for an AT-Key interface which will allow you to do this, you need to
unplug the keyboard processor chip from the original keyboard and plug it
into the interface. Soldering skills required.

Speak to 'ya later!

>
>All and any advice gratefully accepted.

Have you disabled the original (on board) 1/2 Mbyte of ram ?

This can be done by unsoldering the resistors that connect from the MMU to the
RAS & CAS lines on the old memory chips. Tie the chip RAS & CAS pins to the
+ 5 volt rail through a pull-up (1 Kohm) resistor.

I don't have specific details on your board, so I don't know what
modifications have already been done, but I am assuming your 2 meg expansion
board has all of the control lines necessary for the full 4 mbytes.

For some more information, have a look at the umich archive (may be on
Hallvard's site also) for information about memory upgrades. The files
usually have all of the important pin numbers for the MMU & RAM chips.

You need to make sure all of the wires are correct, & while these upgrade
files won't necessarily match your board, they will be useful in checking that
you have the same number of wires & they are in the right place.

>comp.sys.atari.internet would be usefull IMHO.

IMHO it's no more possible for us Atari users to succeed in the
complicated process (proposal, RFDs, CFVs, voting success) to create a
new group (I'd like to be wrong). And (again IMHO) the first group to
create if it was possible would be comp.sys.atari.marketplace or
something like that for For Sale/Wanted adds.

OTOH (always IMHO) there is a perfect and yet existing group for a
technical topic as all this network config stuff, it's
comp.sys.atari.st.tech. Many people think it's only for hardware stuff,
but it's also a group for software technical questions... If all these
STiNG/PPP-Connect/MiNTnet/NOS/STick (that's all?) threads were in
c.s.a.st.tech, the general purpose group c.s.a.st would be less
overloaded for "normal" (??) users not interested by these questions.

Bye! Bruno.

I was given a copy of Populous II - UK version - the other day. I have a 50cycle 'Pal adapt' programme and the thing will load and begin to play - however - about 7 minutes into the game the screen goes black and despite waiting patiently for about 10 minutes for something to happen (if I am anything - it is patient) nowt does -

Does anyone out there have any suggestions - or do I pack the game away and say - oh well !!!!!

THE ATARI ST QUICK FAQ
v2.0 - September 12th 1997

In order to save bandwidth and avoid comp.sys.atari.st newcomers asking
the same questions over and over again, here is a quick list of the most
Frequently Asked Questions (FAQ) and, hopefully, useful answers.

http://www.geocities.com/MotorCity/2090/quickfaq.htm USA
http://wwwperso.hol.fr/~nbales/quickfaq.htm Europe

or

ftp://ftp.sn.no/user/hallvart/atari/info/quickfaq.txt FTP/ASCIIA

If you don't have web or ftp access, send me an e-mail at the following
address, and I will be happy to send the FAQ to you:

bales@hol.fr

This announcement is manually posted once every week.

Nick

I can't remember how good/bad the included Oasis editor was but doesn't
it have an Insert option or anything? I used Everest and you just
needed to Uuencode the file and then insert it.

3524. New ST user questions

Newsgroup: comp.sys.atari.st

From: dlw@Starbase.NeoSoft.COM
Message-ID: <5vpmiaask1@Starbase.NeoSoft.COM>
Source record: 116806

I just received a 1040STfm and I'm wondering how to find how which version of TOS I have. I formated a disk so I know it has a double sided drive but I don't know exactly how much memory it has. Is there some util I can use to tell me all the hardware/OS details? Or do I just have to open up the case and start checking out the chips? Thanks for any help or pointers.

If you have trouble printing under MagiC with Nemesis High try with cache off (you can use the NVDI SI CPX to turn it off) and see if this cures the problem.
It cured the problem a friend had when printing under MagiC and the FX card in 40 MhZ.

Greetings, janne

3526. HD floppy drives

Newsgroup: comp.sys.atari.st
Date: 1997-09-17 00:00:00 UTC
From: bales@hol.fr
Message-ID: <19970917231234162480@ppp103.tou.hol.fr>
Source record: 116808

Just a question about the drive ID issue when adapting PC floppy drives for use on an ST:

I went to a few PC shops to get a 1.44 drive specifying that I needed it to have jumpers for configuring the ID number. They all told me that the ID was given by the cable itself. One even showed me a PC floppy drive cable with 2 connectors, one for drive A, the other for drive B, with 4 wires twisted in between the two.

So what's exactly the deal with this jumper stuff ?

Yep, think too it's only 9% that won't use it.

> It would be paramount that this ability is not lost.

I guess I replied to you in the mailing list already. You can desactivate
the port in STNGPORT.CPX at any time to allow other programs (do not know
Semper) to use the port. Both (STinG and other programs) active at the same
time is of course impossible

> - What use would the link be? To me I'd like to be able to transfer
> files between machines using the MIDI link, would this be possible?

It is possible, by running an FTP server on one machine, and an FTP client
on the other. For the server, look at my web page, for the client, you can
use Newsie, AFTP, mgFTP, etc.

> - If file transfer would be possible I assume it would have to work
> via FTP, and that it would not be possible to have 'remote' drive
> icons on the desktop?

What you're referring to here, is a Network File System (NFS), which I intent
to do later. Right now I'm not working on it yet.

> - Would the NeST mail server still be able to process NeST (fidonet
> mail via Semper) using the RS232 port while I was on the Falcon doing
> a MIDI transfer of a file?

RS232 and Midi are independent ports. If Semper does not mingle with the
Midi port, and you desactivated the RS232 port for STinG, the answer should
clearly be "Yes".

> If you or anyone (Peter) knows the answers to the above it would be
> most useful. Or of course if anyone has already set up that sort of
> config (while not screwing up a standard STing dial-up connection
> link) I'd be interested in the config files.

Better do them yourself, for two reasons. First the LANs are too different,
so copying the config files is not very useful. Second you learn quite a bit
about networking by setting it up yourself, and it's not difficult. Ask me
if you still run into problems.

Does your ISP possibly require CHAP instead of PAP ? This does sound as if this
were the case. CHAP means the ISP asks for authentication at some random time,
even in the middle of the connection. As STinG does not support CHAP as yet,
the ISP won't get the CHAP reply and thus drop the line. The 40 sec might be
the CHAP waiting timeout.

Get back to your ISP and ask them if CHAP is employed. Maybe they can switch
it off ?

Cheers Peter

Thanks for some positive reports on STinG. Sometimes it feels like people
can only complain. Especially bad are phrases like

>> Let's face it: STING doesn't work. So, what's the solution ?

in the other message.

> If I can do it with an hours worth of ST experience, then what is
> the problem everyone is having? There's a lot of documentation with
> STinG, is anyone reading it?

Huh, I guess few people will like this question ... ;-)

I really admit it, the documentation is a mess. But right now things like
debugging of the bloody PPP is more important. And that is also much more
difficult, as I do not see any of the reported problems here with my machine
and my ISP.

> There, I said what I had to. Peter's program is wonderful, however,
> I do miss the old version of ping B*)

Why is that ? What is the 'old version' anyway ? Note the Ping source code
is included in the distribution, you can do with it whatever Ping version
you want.

Very good. Another point.

> 3. I edited the dial.scr to include all the relevant stuff. BTW, I have a
> *static* IP address, which is different than most, it seems.

Right. Third one.

> 4. I edited the route.tab to include the line
> 0.0.0.0[tab]0.0.0.0[tab]Modem 2[tab]0.0.0.0

Perfect. Fourth.

> problems or bombs, but when trying to Ping my ISP's nameserver, it sends
> out lots of packets, but none are received...the modem "send" light
> flickers, but the "receive" light is always dark.

Hmmm. Scored four points, should STinG require five ? ;-)

Getting serious, I'd say, your IP address is wrong, which is however unlikely,
as you say you got a static one.

Do you know the IP address of your ISP's modem server ? Try to ping that one.

> Heres what I found:
>
> 1. In the PORT cpx, under Addressing-Modem 2, it has the Active box
> checked and it specified an IP address of 204.117.4.131 (which is my

> Under General-Modem 2, the active box is checked and PPP is checked.

Sounds perfect.

> 2. In the protocols cpx, under the Resolver option, it has the DNS server
> I specified in the Dial.scr, but under DOMAIN, it has
> stud.uni-hannover.de, which is obviously Peter's.

Yep. This can hurt only in very special situations, not here.

> So, I then looked at the DEFAULT.CFG, and it had all kinds of Peter
> specific info in it...I hadn't touched this file up till now...was I
> supposed to?

Sure, go ahead. Change what you can make sense of. Nothing of the default
settings should prevent your setup from working, however.

> Help! Help! Help! What am I doing wrong? Up until the point of looking at
> the DEFAULT.CFG, I thought I was doing everything right, but now I'm
> completely confused!!

As all you reported sounds very sensible, you should contact your ISP, and
ask them to look at their server while you try to do the name server ping.
It would be very easy for them to tell what goes wrong.

Cheers Peter

It did not occur to you that PPP-Connect might have it's own set of problems ? If you had read german newsgroups, it had ! People report strange problems there too. The other day someone posted a logfile produced by PPP-Connect, which comprised received data, and PPP-Connect's reply. Scrutinizing the log, I was able to prove that it does not correctly implement the PPP protocol.

I'm far from saying that STinG's PPP would work well for everyone. But you should not advertise PPP-Connect as the perfect solution. I do not know how you would have guessed this, maybe because it is commercial ? If so, look at Microsoft to see how well commercial software works.

> I guess 99%, who uses the internet uses CAB this sounds like

> ever and have got it up and running in less than 10 minutes.

See Ken Williams report on how long it took him to set up STinG.

Here in Germany MANY people have bought CAB 2.5 meanwhile. Not quite as many have problems with PPP-Connect, but still enough.

Cheers Peter

Are BOTH NVDI and SpeedoGDOS installed?? Dump Speedo and stick with NVDI and see what happens.

Also, are you using Papyrus' printer driver or one of NVDI's? If you've only tried one, try the other.

One thing I forgot just use the NVDI printers not the Papyrus ones.
Set the colour setting in the image parameters in the settings for
papyrus to the the printer not the screen.

I hope you are not trying to run Speedo and NVDI together. Ditch
Speedo5 it is full of bugs. Just use NVDI 4.11x prints fine and much
faster etc.. Using both together will make the system unstable etc..

3541. PH Player 4.1 - IMA ADPCM support

Newsgroup: comp.sys.atari.st
Date: 1997-09-17 00:00:00 UTC
From: wongck@letterbox.com
Message-ID: <5voqfn$jg9@usenet.pa.dec.com>
Source record: 116823

PH Player 4.1 is available for immediate downloading from

http://probehouse.home.ml.org
http://www.geocities.com/SiliconValley/6880/phsw.html

New in this version includes:
* Support IMA 4-bits ADPCM mono sample files.
* Fix TT-RAM memory.
* Added a couple more sample speed support.

I suggest you visit http://zarak.com/sounds where you can get tons of
great TV, movies & songs samples, all in IMA ADPCM format.

Watch out for IMA ADPCM Stereo support soon!

Regards
William

WinNT does not allow User level applications to directly access the hardware.
This is why WinNT is more stable than Win95. I don't know if DirectX for NT
will help, it still needs to go through the IO manager but it is suppose to be
more resistance to direct hardware access by applications.

9-16-97 >>>>>> [][] ATARI Clearence [][] <<<<<< 9-16-97

If it's not listed, it's been sold!

[NEW][NEW] [NEW][NEW]
Will trade for Jaguar and/or Atari Computer items!

(Email me with what you are willing to trade and what you want)

[NEW][NEW] [NEW][NEW]

PLEASE: When you send me email - MAKE SURE you either include a valid email address or that 'reply to' is correct!!!! Quite a few people have replied to these add's, but I can't reply to most of them, as the mail comes back to me. thank you....

Item : COMPLETE External Hard drive setup
Host Type: ICD Link
Megabytes: ~90mb formated
Type Case: Plus Impulse flat case
~ size : 13"(width) 2.5"(height) 14.5"(depth)
Comments : Includes DMA cable, Power cord, ICD software
Comments : Plug 'n Play - Autoboot w/ICD
Asking : $125 + shipping

I'll be happy to load the hard drive with shareware/pd software.

[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-][-]
M I S C
[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-][-]

If you want something listed below - MAKE ME AN OFFER!

Item : ATARI LAZER 'adapter' box. I can't remember what these are called.
Comments: But they are the boxes that plug into the computer and the lazer printer plugs into this box. Comes with the Lazer printer cord. And 1 DMA cable (as it's built into the box) This box also has a DMA pass-threw.

Item : 6 (?) MFM hard drive mechs.
Comments: I don't know what works, and what doesn't. They all did work when I put them in the box, but I cannot test them at this point.

Item : Blitz Cables
Comments: Allows you to backup your software fast and easy!

Item : ST Sound Digitizer
Comments: Made by Hippo, includes software and cartridge

Item : Video 1000-ST
Comments: Includes Cart and german (paper) docs. Screen rez enhancer (?)

Item : Video Key
Comments: Lets you hookup your atari to a TV

Item : Mouse Master
Comments: Lets you click over between a mouse and a joystick on 1 port
(usually 0)

Item : 1040 power supply
Comments: Needs plug put back on (which I still have - and will include)

Items : SwitchBack
Comments: Difficult to explain what this is. This lets you save anything
to RAM or a file. (Not the best explanation, but best I
can do)

If you have any questions, or your interested in one of the items
listed above, PLEASE Email me! All funds must be in US Dollars.
If you respond here, PLEASE keep the same title so that I can easily
find it.... I will ship ANYWHERE.

One final note: If you email me wanting something, make sure the return
email is good. If it's not, leave me a good email address in email!
thanks (Yes, this is in here twice on purpose <g>)

>combinations with no results. So, I'm at the point where I can upload
>GIFs and things of that nature, but no HTML files (although I did get
>one up once, out of about 120 tries... I have no idea how).

THERE IS NO WAY. I beta tested this version, and complained
to the author at the time, but he said why bother Binary works fine!!!
He was wrong. So you're stuck with binary. One way around it if you can
is to zip it up, and then unzip it inthe host.

Hi all!
Just thought I'd give you an update on the STinG HELP! HomePage..

It is doing really well! People have responded and infomation is being shared between everyone. If you use STinG and have or have not got it to work properly with your ISP.. This page is for you! It also has helpful hints to make things run a bit faster and smoother! If you want drop on in and give advice to other people or just read the advice of others.

Peter Rottengatter the author of STinG also drops in and offers some VERY helpful infomation and tips.

> cares nowdays.

If you can get permissions from the authors then...oh yeah, we've been
through that one before. The only objections from them may be if they
still get royalites(someone told me he still gets royalties from the
8-bit version his game being sold in a 3rd world country :), and if
someone hacks into it and claiming as his own (Heck, don't all crackers do
that?) That's just from some of the responce I encountered....

> The main problem is that they wont work on the Falcon and wont work
> from a HD. :-(((Maybe someone could hack them to run from a HD/CD-ROM
> as well?

Problem is you can't just put protected games on MSA files because MSA
can't copy them, but that obvious fact aside...

One solution might be to make a disk image not much different from
.ST files. First, read the boot sector to get the information and have
the reading program "simulate" the ST drive controller to "read" the disk
and reproduce the data on the file. Then have another program that can
also simulate the ST drive controller and run the boot program, adjusting
on a Falcon in the same way Falcon X does.

Still, it's a theory that has yet to be worked on...but it may be a possiblity someday :)

In <5vqmvt$e7k$1@infomania.emw.ericsson.se> Magnus Kollberg wrote:

>I belive you, but as I said I still havn't read about any problems with
>PPP-Connect. Maybe that is becuase noone uses it, or?

You have a chance for trouble while using the german t-online as isp.
But nobody outside germany use t-online ;)
Also i use ppp-connect since the first time with rhein-main.de as isp.
The point is: My ppp-connect config was done in 3 minutes!
Simply i use all the parameter from FreePPP 2.5, from my Mac.
(Also the complete login script)

Fakt is: Whith exactly the same ppp parameter set i take NOTHING with STinG/PPP

Any questions about it?

Right, also i use STiK/SLIP, that nice and fast.
SLIP also works nice while using STinG, but that's all, not one point more.

When i started to the web with STiK i need 2 weeks to get a nice config.

But that's not the point, after switching STinG simply from SLIP to PPP...
What a joke, i need the LAST TREE WEEKs..
(To get a fucking ping from my static! IP)
Not ANY word by use dynamic IPs ! (That works nice with PPP-Connect or FreePPP 2.5)
So i quit that job last week.

Any questions?

Sure, PPP-Connect is www only in the moment, but i'm sure in few weeks anybody
got the rest from ash! The best chance for me to work with NEWsie, aFTP and also.
(I hope so)

Why?
Not one programer can talk with any other.. What a joke!
(But all that guys do the same) ;-/

(3) I'm looking for CatBoxes for Atari Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs or E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an order of enough of my stock. One example, a customer ordered over $200 of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125 Mono Monitor with a Built in Monitor stand and an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive plus a modified 800xl with a built in Translator on a switch that will run older Software without a Translator Disk Plus Lots more new 8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

ST+ at the U.K. OCTOBER ATARI SHOW

October 18th - Birmingham Motor Cycle Museum
October 19th - London four pillars hotel

ST+, the U.K.'s only monthly Atari diskzine will be holding a stand
at the October Atari shows. We'll have special limited edition,
double disk issue of ST+ bundled with some goodies for a mere £2.50
UKP. All the usual back issue's will also be availible to purchace! We
will also have the latest issue of ST+ for you to check out!. Also
this is your chance to meet and chat with the ST+ team. We will be at
both the Birmingham AND London shows.

BE WARNED!!

This could well be the last Atari show arranged by Goodmans.

It's up to YOU to show your support by attending at least one of the
shows, their great fun and what's more you'll find bargains in
abundence, what more reason do you need to attend!?..

Look forward to seeing ya there!. :))))

>JH> to switch IDs around, the other is to switch Termination on or off.

>I whipped the giblets out of mine the other night to check out the TERMPWR
>issue, and the relevant pin is connected to the internals, ive not had a
>chance to see if its a source of current, but it is connected to somethin

Hi,
I haven't followed this discussion, but it seems like you're having problems with a Zip on an ST. The problem is that the PSU can't deliver enough current to supply the Link (or whichever SCSI-interface you're using) with power. Because of this you have to make a cable that supplies power from the joyport (or somewhere else of course) to the TERMPWR on the secondary SCSI-connector on the Zip. Another solution is to connect a terminated harddisk after the Zip and disable the termination on the Zip - the PSU in the external HD will be able to give power to the interface.

Best regards,
Claes

unmodified STFMs usually have either TOS 1.0 or 1.4. To tell, you can
either check the date in the Desktop Information box, If it just says
(C)1986 then it's 1.0, if there are several dates, then it's probably
1.4

You can also use sysinfo that can probably be found on umich or lip6 FTP
sites. Check out the Quick FAQ (see below)

And you say your self that you use the demo of CAB. As much as
I know ony verwson 2.0 is available as a demo version, 2.5 is not.
I have also heard from several different people that version 2.5 is
MUCH better than 2.0 which is buggy and hasn't got many of the
features found in 2.5. Have you looked at 2.5 at all? Alex has got a
good page about CAB describing what has chagned from 2.0 to 2.5 and
I would say that it's about everything.

I have heard nothing about 2.5 having fixed the worst shortcoming of CAB, the worst for me that is. I'm talking about the compulsory recoding of Latin 1 characters into the Atari standard. Some characters are necessarily lost in that recoding. I need those characters too. Thus I want an option to switch off this, so that I can use fonts that are layed out according to Latin 1 - the Net standard. Those of you who only read pages in English or German won't notice this "bug", but for me it makes CAB almost unusable.

Are you sure about that? I thought it was a version of ADHI (the Atari HD
driver) that did that, and they released a fixed version just as soon as
they found out. I believe it was the version that came with early releases
of the Falcon 030... :)

I was organizing some boxes with old disks yesterday, and I found
a lot of old games which I immedielately started to play on the old
ST. Needless to say, organizing ~100 disks took me almost 15 hours...

These games are treasures, and they are no longer available. Somebody
out there must be sitting on all those "Was (no was)", "Pompey Pirates",
"Automation", "Vikings" etc. compilations, every decent game ever published
for the ST can be found on one of those disks.

What if we collected all those disks and put them on a CD as MSA-files?
Together with a decent emulator and a software/hardware floppy-emulator
for PC/Falcon this would be the perfect way to preserve these games.

Anton,

That sort of question is totally meaningless. Why do people collect stamps? Or why do people collect artwork, why do people collect classic corvettes? Because people enjoy using, keeping and collecting items which are close to their hearts. I personally like to use Netware as a network OS, most of industry is going Windows NT, I also like OS/2, I feel its a much better desktop OS then Win 95, but I use Win 95 to keep compatible with certain pieces of software.

To ask to people to just give up something they enjoy is quite useless and silly. I know people who are still activily running groups for CP/M machines, those were the computers of the 70's that people had to homebrew and build themselves. I don't believe any system or platform should be abandoned just because they aren't bleeding edge state of the art machines. The same applies for video games like the N64, its a fantastic machine, but the games aren't as much fun as games on the Atari 2600, a 20 year old video game system. The games are blocky with lowsy sound compared to anything available today, but the games are great.

Curt

> >overloaded for "normal" (??) users not interested by these questions.

So why can't people keep to that group then so that I can unsubcribe to
it
and subscribe to it later when I need the help, which I don't need right
now.
That is the advantage with having several specialized groups, that you
can
select what you want and doesn't want. I _don't_ want to stop anyone
from
writing, just have the option to choose.

> I'd dearly love to see a "comp.sys.atari.falcon" group, as well! :)

Who wouldn't?

c.s.a.games would be nice to so that we could get a discussion going
about
different things. Now it's a bit hard to know where to post the message,
so
we better don't in some cases. Also mailinglists gets more and more
popular,
probably becuase of that they are more specialized. Like the falcon040
mailinglist. It's not many people who owns a Falcon040 but the list

often produce
more messages than c.s.a.tech does. Then there are lots of other lists
as well.
Then there is the bad_mood mailingslit which get more messages about
programming
than c.s.a.programing gets. BTW. Do you all know that there is currently
a MP3
player being developed for the Falcon? Join the Bad Mood list and you
will know
more. A bit "funny" that the mailinglist is taking over more and more
when more
ad dmore atari people access the internet and we have got great program
like Newsie.

IMHO it would be better to have them as newsgroups insteed of
mailinglists as
it would allow others to look in and decide if they are interrested or
not.

I guess it will never happen though. :-(

If I was to decide I would trash most mailinglists and create some new
newsgropus
insteed to let people know what is going on in the Atari world. Then we
can just
pick those we want and take a peak in those we doesn't read everyday.

c.s.a.games
c.s.a.marketplace
c.s.a.hardware
c.s.a.internet
c.s.a.programming
c.s.a.st
c.s.a.falcon
c.s.a.super_ataris
c.s.a.os.tos
c.s.a.os.mint
c.s.a.os.magic
c.s.a.os.unix
c.s.a.tech

That would be a more sensible and could hopefully get some talk going
and
make some mailinglist obsolete. The only problem would be that I would
not
get anything done at all.... Just becuase we get more proups wont mean
that
they will be empty. On the contarary (sp?), I think this could help us
alot and get
more people active.

So how do you try to set up a newsgroup?

Oppsss... gosh what I rambeld away here....

A great idea and ehumpphh... most compilation disks from the above are
actually available on the internet. I can't realy think that someone
cares nowdays.

The main problem is that they wont work on the Falcon and wont work
from a HD. :-(((Maybe someone could hack them to run from a HD/CD-ROM
as well?

Yes here, but only Version 1.03 (1.3 ??)

>So, I'm at the point where I can upload
>GIFs and things of that nature, but no HTML files (although I did get
>one up once, out of about 120 tries... I have no idea how).
>
>Anyone know how to tell it to switch modes?

No i don't now it, the next problem i have with version 1.03 is that i
can't upload long filenames.

So i upload the file, login with telnet and change the filename and remove
the "^M" with vi.

```
vi <filename>
:%s/.$//
:w! <newfilename>
:q
```

That's the own thing you have to change in the files (unix uses only LF or
was it CR??) at the Lineend and not CR/LF

Agreed. I was afraid that I'll get tons of "you f**kin' pirat!" replies
;-)

> The main problem is that they wont work on the Falcon and wont work
> from a HD. :-(((Maybe someone could hack them to run from a HD/CD-ROM
> as well?

What I had in mind was to make an lead/adapter between the floppy-port on
a standard ST(e) and the parallel-port of a PC or Falcon, and emulate a
floppy this way. This was discussed here several months ago, but I don't
think it was actually made. It shouldn't be too hard though, the
floppy-interface is really simple and should be dead-easy to emulate.

Similar stuff exists for the C=64 and Spectrum, and it works really well.
You can play on the real thing instead of an emulator, without the hassles
with tapes of floppies.

I want to program an telnet Demon for STiK/STinG and MagiC. But what to do
with the security? Someone else can login an do anything with your
computer. So how can we block this securityhole?

In Mintnet it's easy, because there are some "user" mechanics to realise
the security, but in MagiC.... hm

I obtained the full atari directory listing from umich but am unable to identify
files relating to memory upgrades!

My problem machine is in bits before me as I write. I thought a short(ish)
list of connectione/disconnections may give someone more technically
profficient than me a clue to the solution.

R73 67ohm Resistor linked to original RAM and upgrade board
R72 75ohm Resistor linked to original RAM and +5 volt rail + original

resistor wiring point linked to upgrade board
R71 75ohm Resistor linked to original RAM and +5 volt rail+ original
resistor wiring point linked to upgrade board

R59 67ohm Resistor linked to original Ram and upgrade board
R60 75ohm Resistor linked to original Ram and upgrade board
R61 75ohm Resistor linked to original Ram and upgrade board
R62 22ohm Resistor linked to original Ram and upgrade board
R63 22ohm Resistor linked to original Ram and upgrade board
R64 22ohm Resistor linked to original Ram and upgrade board
R65 22ohm Resistor linked to original Ram and upgrade board
R66 22ohm Resistor linked to original Ram and upgrade board
R67 22ohm Resistor linked to original Ram and upgrade board
R68 22ohm Resistor linked to original Ram and upgrade board
R69 22ohm Resistor linked to original Ram and upgrade board
R70 22ohm Resistor linked to original Ram and upgrade board

I believe I translated the resistor values correctly!

Finally, in addition two wires from the upgrade are soldered to terminals
23 and 63 respectively of the MMU.

In short two resistors have been wired to the +5 volt rail, which indicates that
that before I added an additional 2meg of DRAM I should only have had access
to 2meg of RAM but I actually had 2.5meg!!!

Help Please

Den

:
: So how do you try to set up a newsgroup?

I don't know exactly how it is doen, but a year or more ago there was a strong movement to create some more groups. I know comp.sys.atari.marketplace was one of the new groups proposed, as I really wanted that one so I could stop skipping all the FS posts in this group.

I know there is a whole process that one has to go through to get a group in the comp.sys series, the only one that is really easy is the alt series, but they don't propogate as far so many readers wouldn't be able to read them. Much preferable to follow the steps to get into comp.sys. I don't know what all these steps are, but I think Tich Tietjens was working to get the proposals through last time. Then he got badly spammed and mail bombed and dissapeared from this virtual community. If you can reach him (maybe try PAC.President@atarinet.portland.or.us) he may be able to tell you waht the steps are, and how far he's gotten with the proposals to date.

>Al Ferrier /|\
>sonik@zetnet.co.uk

..load a RAM disk on boot at same time as STiK from a floppyand configure C
to look for the Cache on the RAM disk. You don't have to load CAB/STiK into
the RAM disk as they reside in memory anyhow!

STiK needs the root directory.

I am running 3 versions of CAB - CAB 1.5 and 2 and 2 with .ovl 1.2618 and
on a 4Mb STf no HDD, DSDD floppy and the trick is to format your floppy
with an extended formatter to 83K

I hoped a resetable RAM would be the way to go, but when CAB/STiK crashes,
the area of memory resided means you have to press that reset button several
times to get the machine back to life...

Cheers.

Mark

Body handling: HTML body converted to readable text

Thanks to those who responded to my previous posts,
my MEGAFILE is now sold! ;-)

The following items remain FOR SALE/TRADE:

* 4160 STE (TOS 1.62, 4 Mb) ==>> ie: 1040 STE @ 4 Mb
* MEGA-ST 4 (TOS 1.04, 4 Mb)
* SLM 804 Lazer Printer
* STM 1 Mouse
* Softwares
DTP: Timeworks - Publisher
Soft Logic - Publishing Partner
Music: Dr.T - D-50/D-550 Editor
Dr.T - D-10/D-110 Editor
C-Lab - Notator SL 3.1

Offers from Canada and United-States only!

Preferably TRADE against following products WANTED:

* MEGA-STE (TOS 2.06, 4Mb Ram, Internal HD)
* STacy 4 (TOS 1.04, 4Mb Ram, Internal HD).
* Crazydots-2 graphic card for TT (or equivalent ET-4000 card)

NOTE: Canadian banks cause troubles for cashing foreign currency
of any kind, including American. This can be avoided by an
electronic fund transfer (Western Union or similar), which
is usually cleared within 48 hours of transaction.

Nonetheless, if you're interrested in trading your MEGA-STE
or your STacy, we can arrange something, as no money would
be trading hands accross the border.

Complete list of items I'm selling or looking for on my homepage.

3596. SF314 Upgrade

Newsgroup: comp.sys.atari.st
Date: 1997-09-18 00:00:00 UTC
From: Stephen Knox <gooch@pop.erols.com>
Message-ID: <34217F0E.5314@pop.erols.com>
Source record: 116722

Awhile back I posted a msg about a SF314 drive that had gone bad. A look at the FAQ stated that I could use an IBM 1.44 to replace the mech but to make sure I got one with jumper settings.

Well,

I got a new drive and installed it. After messing around a bit I was able to get my Mega2 to recognize the drive as drive B. It will read/write the drive but cannot format it. It doesnt take but a 1/2 second for the format command to come back with an error (mo msg just that it didnt work).

Anyhow,
I have what appears to be a Sony drive(Theres a sony label on it). The jumpers look as follows:

X X
X o

There are only 3 contacts, the 'o' doesnt have one. Out of the box the jumper was set as follows:

J X
J o

This configuration didn't work (assume this identifies the drive as ID 1)

I changed the jumper to the following:

J J
X o

This worked for the above situation but I cannot format.

Anyone have any clues? If I leave the jumper off the drive doesnt work.

Thanks,
Steve

PS,
Please respond email since I dont normally read this group.

I have set up the port setup cpx as active as well. I also have the DTR ignored on the modem and use ,+++,ATH as a hangup string. This is so if I have to do a re-boot, I don't get logged off or the modem hanging up.

This is a large boost when something that goes belly up, and I'm quite happy to have this minor inconvenience.

Ah, sorry, I made a mistake and have been corrected! It was AHDI 3.0
which wrote beyond a partition's limits. This "Cluster-2 Fix" looks as
though it was meant to cure this.

Apologies to all TOSs! They may have some failings but none so bad as
trashing partition+1.

Well, I do have some problems with PPP-Connect but I'm using Multitos and
PPP-Connect is written to work along with Magic that I do not have yet.
However I can get it to work with Multitos but not as well as Mintnet
with/without Gluestik. And the ovl for ppp-connect "only" understands 'http',
not 'mailto' for example.

Next in c.s.a.st.tech ;-)

3608. Note on STiNG/Falcon 2-bomb bug

Newsgroup: comp.sys.atari.st
Date: 1997-09-18 00:00:00 UTC
From: csh@agate.net
Message-ID: <874599698.1516@dejanews.com>
Source record: 116734

If it helps any, as I was continuing (unsuccesfully) to get PPP Sting working on my Falcon, I discovered the following:

I can connect fine and everything (except I can only Ping 127.0.0.1--same old problem) and I don't get bombs, but then if I disconnect, then try to connect again, I get 2-bombs at the end of the "countdown" after the dialer has connected.

Arrrggh!!! I still think I'm doing everything right, yet it won't work!!

Peter, if you want a Falcon owner who can't get STiNG to work with PPP, let me know...I'm VERY willing to help out with testing or anything --but you probably hear that from a lot of people ;-)

>wires twisted in between the two.

Hi,
Obviously, they have no knowledge about how the drives work - they only sell the stuff, something that's VERY common among PC-shops!
All PC diskdrives are jumpered as unit 1 (Drive Select 1) and the Atari can't recognise anything but unit 0. In the PC's, this unit number is fixed by the twisted cable. Some drives have small jumpers that let you change the drive select, but some don't. Some drives have the "jumpers", but there aren't any pins that let you change the unit number easily - you have to cut a soldered "jumper" and re-solder it the other way around (3-way jumper field). Just ask them if you can look at the drive and check out if there is a small printing on the PCB saying DS0 and DS1. Then you should be able to use it. I've used both Sony and Teac drives with great success.

Best regards and good luck!
Claes

>you squees a bit. I think there are textfiles telling you how to do it
>and what
>is needed.

All that's needed is an adapter cable between 2.5" and 3.5" and you can
connect just about any EIDE-drive. However, if you want to use EIDE's that
are larger than 1GB I'd recommend that you use HDDriver6 or later and a
Quantum Fireball HD, which I have very good experience from (I have one
1.3GB and one 2.1GB Quantum Fireball EIDE connected to my Falcon - in a
tower case...).
If you have trouble finding a shop selling Atari stuff, you can get the
adapter cable at an Amiga shop too - it's the same they use for connecting
3.5" EIDE's to the A1200.

Best regards,
Claes

Why the hell is that ??? Unix shells do not need any terminal emulation, it's
only the programs you wanna run from them that might need it. And well designed
programs would work well with VT100 too. An example is Pine.

Note I do Telnet logins to Unix machines frequently, not least to my Linux
machine which sits right next to my Atari.

> Don't ask me why, it's just so. I've tried 102 etc. under Windows95.
> I don't know too much about telnet, so I don't really know the differences.

Aaaaargh, get a real telnet, and you won't have problems.

>> Unless I am wrong, Peter isn't looking to write a new Telnet, since
>>he spent a good deal of time helping me get TelVT102 into shape. If you

>>description of the way each of the control codes works and I'll fix TelVT102!!
>>That would seem to make more sense, since the framework is already there.

Boris, before you started to work on the TelVT102, I had volunteered to rewrite
the Telnet stuff. This was well over a year ago. I got quite far, but then ran
into some bad bug, and found myself instead busy with developing a TCP/IP stack,
which took all my time. It's just that I managed recently to get it in working
shape.

It still lacks quite a few of the VT100 features, and I'm not too eager to fix that soon, too many other things on STinG are still to do. And this is too where your TelVT102 comes in, it is indispensable if someone needs a true and complete VT102 emulation. But most people with little unusual video hardware have problems with it, as it still does not use the VDI properly (I believe this is where you derived the speed from, VDI takes time). So these people will find my TelStar useful. It has some other distinct features too, find out yourself ...

Those who want to try it, find it on my homepage.

Cheers Peter

It says its 720/1.44 compatible. It is weird that it will read/write
but won't accept the format command from the ST?

I might just return it and try the mitsumi (It was $5 more)

Thanks,
Steve

I want to apologize to everyone who sent e-mail about the 1400XL and 815 disk drive I have for sale. I switched to a Falcon for internet access about a month ago. The Falcon kept crashing and causing garbage to be written to my hard drive, wiping out whole directories. I repeatedly lost my e-mail. Program would just stop working and I would have to reload software over and over. I have now switched to a TT for internet and everything should be stable.

Hi,

: This drive should work. Generally any SCSI drive works. Note, however,
: that the Fireball requires that you use a driver that supports initiator
: idenfication, e.g. HDDRIVER. Otherwise your drive won't be recognized.
: Also note that you won't be able to boot from drives requiring initiator
: idenfication. In case you boot from an internal IDE drive, this won't
: matter.

Okay, I have a Quantum Lightning drive since before so if I keep it as
the boot drive I guess everything will work out just fine then. The
initiator thing really confuses me, though, for what use is it?

Thanks for your help,
Daniel Hedberg

I would like to sell the following items to the highest bidder. If you have bid on any of these items before, I apologize for not returning your e-mail. Please see my other post about problems I was having with internet access.

I have a 1400XL for sale. This is a real 1400XL that I got from Atari in 1985. The case is a 1400XL case but the 1400XL sticker was removed before I was allowed to take it from Atari. It works fine and comes with the "brick" power supply needed for the 1400/1450XLs. I had received a bid of $120 before I started losing my e-mail. If you are the person who made that bid, please let me know.

I have a 815 disk drive for sale. This is a double drive double density unit. It looks like a very tall 810 with two drives. Atari never sold these drives because of problem with manufacturing them. Very few of them made it out of Atari. The drive works fine but uses a special format that no one else used. When Percom started selling double density drives for the eight bit, they picked a different format and then everyone else followed. I had also receive a bid of $120 for this drive from the same person who bid on the 1400XL.

I have a working ATR8000 and a non-working ATR8000 for sale. These are CPM computers that are cabled to the 8-bits using the SIO. You can the use CPM on the 8 bit Atari computers. The ATR8000 has a built in floppy port, printer port, and serial port that can be used by the Atari. You can use standard floppy drives. If you want more info, I will pull out the manual and post the specs.

I have a working Percom double drive double density drive for the Atari 8bit computer. The model number is RFD40-S2. There is a standard ribbon cable connector on the back for using standard floppy drives. I added switches and leds on the front for power on/off and defeating the write protect of each drive.

I have a Chalk Board for the Atari 8bits with MicroMaestro, BearJam, Leo's 'Lectric Paintbrush, and LogisMaster. There are very good for young kids.

I will ship UPS-COD with you paying the shipping. Send me e-mail with you bids or any questions.

thanks,
al

Hallvard.

Are you sure the printers are in the proper emulation mode? The
1080 has an IBM proprinter emulation together with the Epson FX, and the
Canon BJ10 besides the Epson LQ emulation has a "canon mode" that works
with IBM proprinter 24XL pin drivers. This both printers have dip switches
to change the emulation mode (remember to reset the printer after change
them). IIRC, one of the self-tests (turn on the printer with one of the
pannel buttons pressed) will print out the settings, including the current
emulation of the printer.
By sure NVDI is properly installed :-).

Regards.

Daniel.

3622. U.T.S.I and your collaboration

Newsgroup: comp.sys.atari.st
Date: 1997-09-19 00:00:00 UTC
From: dipching@ping.be
Message-ID: <874701684_OASIS_@ping.be>
Source record: 116593

Hi,

I would like to receive your collaboration about the Ultimate TOS Software Index...
Some people have already remarked they have difficulties to read the U.T.S.I pages ...
It seems the problem essentially comes from browsers. Sure, my pages have been conceived with the excellent CAB 2.5 ... using a clean and carefully elaborated html language ... at least I hope ...

The problem:
Some visitors have spoken about the impossibily to read some colored characters because of the multicolored background which lays on the whole page surface, NEVERTHELESS, each html table box has its own background color, and should then show its own colored background above the general page background ... with CAB, it works perfectly and on Internet Explorer (PC) it seems to also work. It seems that using other browsers (which are unable to show correctly these pages), the reading of U.T.S.I pages becomes virtually impossible ...

IF YOU HAVE ENCOUNTERED THIS KIND OF PROBLEMS DURING YOUR VISIT TO THE U.T.S.I SITE ... PLEASE LET ME KNOW ...

Can I then ask to you to give me more information about the computer and browser you use ... THANKS

My goal is clear, keeping the site accessible and readable by almost every possible browser ...

NOTE *1* Some visitors have not missed to criticize, without any answer to my questions about their computer and their browser; this is totally collaboration less ...

NOTE *2* The french WenSuite browser(abandonned ???? ...) is totally unable to read correctly html tables ... Matthias Jaap, HP-Penguin's author don't hesitate to speak about this problem in his Penguin 2 user manual ... this commercial version should be available soon ...

All WenSuite/Webspace releases (the newest one was 1.70i) have problems (not only) with pages created by the Penguin! These are bugs inside the WenSuite html parser - HP-Penguin creates clean pages which should be viewed correctly even by the most intolerant browsers.
Oxo Concepts are working on that problem. Until then you should use CAB 1.5 or the commercial CAB 2.5.

I can only disuade you to use this program until now. As you also have

remarked this program is now becomed a phantom ... and I'm the first
regretting that fact, believe-me !

I also want to THANKS everyone who gave me help and support for the
building and maintenance of this site

I have the secret hope to suscitate a real collaboration to the U.T.S.I

Actually, all ST emulators are asking for a TOS "Image" file which is a
copy of the ROM program on a disk...so in a sense virtually all emulators
are 'software' only. The only two exceptions is the Janus board which is
a complete ST computer and Gemulator which lets you pug in TOS ROMs on a
card, but you can still use TOS images anyways.

Now, to run ST programs without using TOS at all you need TOS2WIN which
makes them run as Windows 95 applications. Now I said applications since
it only works well with GEM and TOS applications...so games are definitly
out.

My problem with your pages comes not so much from the design, but from the fact that the actual list of links is three pages in, and both intro pages are loaded with graphics that take a long time to download and decode. Speaking personally, I'd rather have something functional but graphically spare - why not have all the links on the first page?

I know that I could easily turn off the graphics in CAB, but the first time in, I didn't realize that it would take so long. In TT medium resolution, just about any background image, when dithered to 16 colours, makes whatever text is in the foreground unreadable. Since this is an Atari page, why not make it more Atari friendly?

Well, I can't help with the Panasonic, but the Canon should work fine,
I've been using a BJ10ex for years with most varieties of GDOS
(currently NVDI 4) and Papyrus versions since 3.58 (currently 5).

It sounds like a setup problem with the printer: to use the GDOS and
NVDI drivers you need to set it to IBM Proprinter emulation mode 2
with alternative graphics mode switched on (this lets it recognise
24-pin type graphics). This setup then works with all the GDOS
versions I've tried, and NVDI 4, and also with BJ10 drivers for
Calamus, Arabesque, Imagecopy etc. Also most graphics programs will
print OK if they are sending stuff for 24-pin printers (eg PAD,
24-pin screen dump utils etc).

Assuming that your version will be similar to those sold in the UK,
check the DIP switches under the cover and set them like this:

ON X X

Hi Robert,

in a message dated 19 Sep 97 Robert Schaffner wrote:

RS> STinG does not work with PPP.

It works here on my FALCON, exept the bug with the second attempt that Peter
is aware of (and looking for) and the lack of speed. BTW, did I say that I
cannot have it to work under Multitos but only single Tos ?

RS> PPP-Connect works fine, but only www.

Well, do you use it with Multitos or Magic ?
I don' have the later, so MintNet is far better for me...

Bye Robert,

Use the epsom LQ drivers for Cannon BJ printers just flip the end
dipswitch to set this and it works fine. NVDI or Speedo other wise
there is strange spurius characters printed at the top of each page
and usually garbage printed on the page.

I totally agree with that sentiment, a LOT of so called ATARI pages are laden with jpeg and midi sounds and java and all manner of stuff that slows even my 33.6 and mie3,
If its an ATARI page then it should be "Easily" accessible using an ATARI ST with CAB in medium rez...at least!

You can make a page fully ATARI accessible and nice to view, and check it out in CAB using high rez as well,lots of people have that type of setup...

Well, as long as all the games on the CD are authorised/released as PD,
then I don't see a problem. However, if they are not then... :)

As far as nobody selling them/nobody cares let me tell you a story. One
of my fav Atari companies over the years has been CeeJay Software. They
buy and sell used software and hardware, offering some of the best darned
prices you'll ever see. They're good people. Now, they are going out of
business due to various reasons, including a lack of sales. I wonder how
much of that comes from attitudes/actions like whats been discussed above.

So please don't say, nobody cares...
CeeJay's did care, and did try...
(and they did help-it wasn't a waste)

That's almost certainly because you haven't set AGM as above. If you
set it, and Mode 2, the NVDI/Speedo drivers are OK (no spurious
characters here!). Though just going for Epson emulation across the
board as you suggest should work just as well for most things. Take

your pick!

Do the Epson LQ drivers support 360dpi, or are they just 180dpi?

>
>Thanks a lot
>

Back in 1993 I had a 1040ST which's floppy died as I tried to
save a text file. Needless to say, the file wasn't saved. As an extra
bonus, two other files on that floppy were erased.
The good news is that it probably isn't your floppy drive. So
don't go running out to buy a 1.44 Meg PC floppy. Believe it or not
the problem is probably the Yamaha Sound chip. That chip does more
than just generate sound. I think it also drives the printer port.
Anyway, you can get another Sound chip from Best Electronics. at 2021
The Alameda, Suite 290, San Jose, CA 95126. And it wouldn't hurt to
buy their catalog either.

It's interesting to note that actually getting 1.44 Megs out
of a 1.44 floppy drive on a Atari STE isn't just a matter of plunking
the drive in. You'll also need to upgrade to TOS 2.06 and get the AJAX
chip. (Best has them) Otherwise you'll be stuck with just plain old
double density.

As far as I know, this should work. Are you sure that your Sony drive
is O.K. ? Since there is no difference between writing and formatting
from cables point of view (they both use WD and WG lines), only thing
that comes to my mind would be that drive is either broken or not meant
to work with 720 K at all.

In past, drive used density hole in floppy disc to inform computer about
density (DD/HD) and to regulate various parameters inside drive
(magnetizing current, precompesation etc.) according to magnetic
material on the floppy disc. As time passed, more and more manufacturers
decided to omit passing that info to the drives connector, as PC's (main
market) use HD anyway, and even with the other formats trust BIOS rather
than HD signal to determine disc's density.

It is possible, that some of them abandoned 720 K format completely.
Mitsumi always worked great for me. Some month ago I bought 6 of them,
and installed 2 in QL, all others were inbuilt in various ST's with and
without HD electronics, and all of them are working good.
In the last two years, I bought over 100 of those and I can not remember
that I had to replace a faulty one (99% of them went into Atari's).

Regards,

Branko

I have over 1,000 titles ALL FACTORY SEALED!!!!!!!!!!
If you have a hard time finding Atari 8 or 16 bit(excluding
Jaguar,TT-030,2600,7800,5200 and Falcon) than E-mail me and I will send you
my latest listing. Please specify which listing you want.
Also have IBM,C-64,Amiga and Apple II series listings. All software is NEW
in original factory plastic.
We have very good prices because we do not advertise. WE WILL SHIP ANYWHERE
Thanks

>ignored on the modem and use ,+++,ATH as a hangup string. This is so if I
>have to do a re-boot, I don't get logged off or the modem hanging up.

Hm, if i use the port.cpx, my machine is freezing (or bombing) directly before
or while connecting. Further than, after a long time of some experiments i got
a answer for ping 127.0.0.1 AND my static IP. But that's all, not more.
No data. If i use pap or my login script, thats allways the same effect.
No Data.
STinG does not work with PPP.

PPP-Connect works fine, but only www.

Regards, Robert

> Fireball ST 2160Mb Ultra-SCSI, would it work?

This drive should work. Generally any SCSI drive works. Note, however,
that the Fireball requires that you use a driver that supports initiator
idenfication, e.g. HDDRIVER. Otherwise your drive won't be recognized.
Also note that you won't be able to boot from drives requiring initiator
idenfication. In case you boot from an internal IDE drive, this won't
matter.

3657. Ramdisk for TT (10 MB)?

Newsgroup: comp.sys.atari.st
Date: 1997-09-19 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5vt15n$fsl@alexander.INS.CWRU.Edu>
Source record: 116662

Is there a ramdisk that is compatible with a TT that has 10 MB
of STram and 16 Mb of TTram? I have tried maxi-disk and HRamdisk
(that comes with Lattice C. Both of them seem to load at the 4 MB boundary,
and leave a tiny fraction of the ST ram.
I tried a 2Mb Ramdisk, and wound up with 2 Mb of STram.
Even worse, it BOMBS with GENEVA!
I need a ramdisk for use with Lattice for the intermediate files.

It doesn't even need to be boot=proof.

3659. Re: Parallell ZIP Drives

Newsgroup: comp.sys.atari.st
Date: 1997-09-19 00:00:00 UTC
From: 404on040@remove2reply.iwvisp.com
Message-ID: <5vtkgr$hk1@news.iwvisp.com>
Source record: 116664

Not to stir up any stuff, but...

I got to thinking about all the statements concerning the parallel port on the Falcon. Ok, so it is missing some wires, I guess. I haven't looked at the schematics and comparied them to a PC type port (yet).

Now, this is just a thought, if it is no problem for Digital Arts to write a scanner driver that works with the parallel port on the Falcon, transfering data directly to either an IDE or SCSI drive, what is so hard about utilizing the port for other devices?

I think that is how the Connect (sp) camera kit works too. I mean, you can send commands to the
scanner, make it do its thing, and transfer the data right to a hard drive. What is the difference with the Zip (other than there is no software for such a setup)?

If the ES1200 Epson works like this, I'm sure their slide scanner would too. Now I wouldn't go out and buy one just for that purpose, but I wouldn't mind hooking up a Snappy for shits and giggles.

Lets hear a logical reason why the scanner driver works (and fine it does) and why it would be so hard to utilize other parallel type devices (assuming someone wrote the drivers).

Thanks for any input.

Mike

Source record: 116666

Dear fellow Atarians

Many thanks for all the help I received from
some subscribers to this NG re my problems with
CAB,STiK and Ramdisks. I believe that this has
now been resolved.

For the record, anyone out there who wants to see
a decent speed improvement in CAB's WWWCache folder
access could do worse than put something like Maxidisk
in their auto folder (after STIKSTR.PRG and HSModem)
and redirect cache data to the new partition. It's
also useful with Newsie as somewhere to put your e-mail
editor (Everest, etc) and your mail folder(s), though
if you intend to read your mail offline at a later date,
it may be a good idea to copy the files back to a floppy
before powering down.

It's early doors, but I will monitor my phone bills to
see if this makes a significant reduction to online costs!
One day, I'd like to see an ISP with a freefone 0800 log-on
number, something which would make the Net (and that ISP)
VERY popular and reduce ongoing costs to just the cost
of the subscription rate to that ISP. Radical? Maybe, but
I think someone should take the plunge. If the Net is to
be the new mass medium, this could be a significat first step.

Cheers again

Al Ferrier /|\

You should find one for MiNT in the usual MiNT places. I believe you could
try ftp.cs.tu-berlin.de (or was ftp.fu-berlin.de?) where a lot of MiNT
things are.

I always use the RAM-Disc filesystem for MiNT which has the advantage of
dynamically resizing according to what is put in it. It is also handy in
that it doesn't have the ridiculous 8+3 filename length limit like other
RAM-Discs.

Alternatively, I have heard that Truedisc (I hope I've got the name right)
works very well and is compatible with many systems.

Hi Hallvard,

Just a thought - I have a BJ200ex working very well with NVDI4.11 and Papyrus5. This can be changed between BJ-Mode and Epson emulation via dip-switches. Using the wrong setting with the wrong printer driver can produce the effects you describe. It may be worth trying both Epson and BJ-10 drivers. It also has an Auto-Detect mode which does not work most of the time regardless of the driver used, so you better check that that is not switched on.

Hallvard Tangeraas wrote:

In article <5vre4amai1@infomania.emw.ericsson.se>
Magnus Kollberg <Magnus.Kollberg@**emw**.ericsson.se> said:-

>And why is that? Why can't we create new groups when there pops up new
>crap groups all the time?

It's not really impossible, but it's a hard process to create a
group in the comp.* hierarchy. One of us has to learn how to write a
proposal (there are help documents in news.announce.newusers), then
write a formal "Request For Discussion" with reasons for creating the
new group and a charter. This RFD must be crossposted to all atari
groups and news.announce.newgroups, and the discussion for/against the
new group will take place in news.groups where some of us must go to
support the proposal. This group has much traffic. If there is general
agreement on the proposal before 30 days, a "Call For Vote" must be
posted, and after a 3 or 4 weeks voting period the votes are counted:
the new group will be created only if 2/3 are YES *and* there are 100
more YES than NO.

[comp.sys.atari.st.tech]
>So why can't people keep to that group then so that I can unsubcribe to
>it and subscribe to it later when I need the help, which I don't need
>right now.

Some just don't care. You need to suggest them politely to use
better the yet existing groups. Or insult them, it could work better ;-)

>That is the advantage with having several specialized groups, that you
>can select what you want and doesn't want. I _don't_ want to stop
>anyone from writing, just have the option to choose.

You understood Usenet! Bravo!

>I guess it will never happen though. :-(

You understood Usenet! Bravo! :-))

>If I was to decide I would trash most mailinglists and create some new
>newsgropus insteed

Mailing lists are usefull also... IMHO.

>Prof. Boris D. Cahan

Hi Boris (Prof.?)...ESS Code is a very solid program that works very well
for me...how about some more details? Is ESS Code giving an error message
or is the finished file unuseable? What settings are you using? (You could
send the MIME file to me or post it here, if its not huge, and we'll see
if we can decode it correctly) See ya! :)

I post this message about once a year so... I'm still wanting to buy
Ultima Six, box not necessary but would be nice. Would like to have
all docs, manuals, accessories, etc,... Perfectly willing to pay fair
market value for it, if in good condition. I actually had a shot at
a copy (bidding war) but my last bid ($45) got there just -that- much
too late, and the seller shipped it to the other guy (lucky dog). :)

SSweet@fortress.org.uk wrote (about parallel Zips on an Atari):

>It wont work, maybe you should consider the SCSI version and get your PC
>upgraded to a SCSI interface.

Speaking from experience:

If you have a spare IRQ and slot on your PC for a SCSI card, I'd
recommend the SCSI Zip over the Parallel any day - even if you didn't
want to use it on your Atari.

The transfer rates of the two versions say it all, really (from
www.iomega.com/product/zip/zipspec.html):

SCSI model: up to 60MB/minute
Parallel port model: up to 25MB/minute.

As well as being able to use it on the Atari, an added advantage is
that adding a SCSI card to your PC will also leave you free to add
additional hardware as and when you wish, useful if you want to add a
CD-recorder/extra HD/scanner, etc.

: Some just don't care. You need to suggest them politely to use
: better the yet existing groups. Or insult them, it could work better ;-)

I just took a peek in this (c.s.a.s.tech) group for the first time in months and it is _all_ cross posts from this newsgroup. Why would I want to read the same messages twice?

If we are going to encourage a divison of messages between these two groups, which will necessitate that I and anyone else who is interested in a range of topics that will spread over both groups, we will have to also start rapping nuckles on those who blindly crosspost messages that really belong in _one_ of the newsgroups.

And, in order for all of the above to work, we need to be able to define the difference between the two groups in one simple sentence, otherwise people will get too confused and post to the wrong group.

With more groups at our disposal, it might be eeasier to come up with the simple describing sentences, but they may not be a luxury afforded to us.

The printers are obviously not recognising the codes sent by the
driver to put them in graphics mode so that following "bitmap" data is
not being actioned correctly.

Hmm ... clear diagnosis but what about the cure :-))

>I've also tried Papyrus' own printer routines. that doesn't work either :-(
>Any ideas anyone?

If it fails with this as well it looks as though you are selecting the
"wrong" printer driver in both applications. Are you sure about the
printers' DIP settings? They often have emulation modes other than
Epson.

Does the printer do a "straight" ASCI print from the desktop? There
could be something wrong with the cable - data line broken/shorted.

Have you tried a very simple ASSIGN.SYS? There could be rogue fonts
etc. in your set up which are confusing NVDI.

> copier/formatter).

At least on the MegaSTe, the HD didn't work properly until I switched a DIP
to "HD-mode". I believe TOS 2.06 automatically selects the step-rate depending
on what disk you use (HD or DD). But 2.06 is not *required*, a small auto-folder
program to set the step-rate is usually enough. DD's gets slow though.

> putting forward...

We're talking about thousands of titles here, it would be impossible to collect originals of all these. And floppies doesn't last long either, several of my old originals are now unusable. And where can I get new disks, when nobody's selling or supporting the game anymore?

As a commercial games-machine, the ST is dead. A few are still making semi-commercial/shareware-games though, and I'm *not* planning to rip these off! I'm talking about the classics here, games that hasn't been sold in the shops for ages.

If nobody collects them and stores them in a more secure way than floppies, they will die and disappear in a few years. Call it piracy if you want.

> We are not talking about companies... stuff them :).. I am talking
> about fellow ATARIans who have obtained there software legally with
> there money, the value of there purchases goes to nothing if you take
> it upon yourself to give it all away..

Collectors will still pay good money for fine originals, so this isn't a problem at all. The value of originals will rise in the years to come, just like Spectrum/C64-originals has done in the past.

> AGAIN..this was not my point, my point that you and Roger Cain who I
> originaly answered to, and some other well known ATARIans are trying
> to make excuses for supporting software piracy....thats my point!

I'm NOT supporting piracy of commercially alive software! IMO there is a slight difference between collecting old compilation-disks and spreading copies of Papyrus or Apex.

> So its alright to rip off the honest ATARI community because you
> think its time ?....hmmm

Look above.

> >Automation-disks and make a CD, nomatter what what you or other moralists

> hahahaha, what on earth are you talking about?.. everyone is doing
> it, every single pirate compilation ever made is readily available for

> download of the internet, you missed the boat, there already out

I'm completely aware of this, and the internet is my primary source for games today. I'm just trying to collect them in one place and store them for the future. It would have been great to have originals of every ST-game ever published (If I had anyplace to store them!), but let's face it, the binaries are the important thing here.

> AGAIN my point was NOT doing it, my point was the lame excuses you
> and your supporters come out with,

So piracy is fine by you as long as the pirate admit that he actually *is* a pirate? OK, so I'm a pirate ;-)

> >says. Spend your money on new and modern software instead, you're not
> >helping anybody or the ST-community in general by wasting them on old and
> >unsupported games.
>
> HAHAHAHA I think a hell of a lot of tempest, dungeon master and all
> manner of game players will dissagree with you there,

If you had a 200UKP annual software-bugdet, where do you think the money would be best spent? Buying software like Papyrus, MagiC, NVDI, Apex, Texel, CAB, Geneva, Freedom etc., or buying a heap of old game from some guy that's cleaning up his basement?

> BTW what support do you want in a game ?....sheesh :)

Gee, a new disk when the old one finally dies? A new disk-drive when the f**kin' (and noisy!) copy-protection jams the head of my drive at track 86? (It actually happened to me back in '88) A upgrade when I discover that a poorly written game doesn't work on my new TOS? Pretty much the same as for any other piece of software I guess...

> BTW a smile here and there wont hurt, its just a debate, not a war :)

:-) :-) ..but I'm not the one using frases like "HAHAHAHA", "LAME EXCUSES" etc.

3686. cab & modem speeds

Newsgroup: comp.sys.atari.st
Date: 1997-09-20 00:00:00 UTC
From: andrew.styrmo@bbs.trideja.com
Message-ID: <874775186@bbs.trideja.com>
Source record: 116541

Currently I am using a 14.4 modem with my Falcon/Cab/Stik setup.
Is anyone surfing with a Falcon at 28.8? 33? 56? Please let me know
your experiences and what the fastest modem I should get for my
setup. Does the brand of modem make a difference with Cab?

Is there any way to test the throughput of the modem with Cab other
than to watch how fast the bytes come down the line? (holy
inaccurate methods batman!) I have read in a PeeCee modem forum of
many users of 56K modems trying to connect with 56K servers and
maxing out at 33K!

Thanks in advance for any info.

Andrew

p> and save them ... but maybe there is a better way ...

Hello Peter

There are two TTP utilities that can convert 1st Word Plus files to Rich Text Format: Kevin Millican's FW2RTF.TTP and Jeroen Scheerder's WP2RTF. There's also AJAX.TTP which removes all non-printable charcaters and leaves pure ASCII, though you lose all print styles etc with this. All are PD and should be available from most libraries.
AFAIK you have to use them file by file and can't operate in bulk, but at least they needn't be loaded into 1WP first.

Regards
Peter

Yes, I've thought of that, but it doesn't seem right somehow! At present the
meter represents something like a 15 Megohm path to earth.

r> Sounds a bit like old age and some component gone marginal. Check
r> some other resistors, especially around the small transistor which
r> drives the base of the switcher. These may have cracked etc. and
r> may not be supplying enough bias current to the switcher.
Yes, I'll do that after I have fitted a spare psu that Derryck is lending me.
Thanks for your suggestions

SS> did you get displayed in the title bars.
Just the path to where the file selected in the system fileselector was, with a trailing backslash and no file name.

SS> BTW, where did you get EVEREST 3.8, is it english, where's my
SS> copy. 8~))
That was a mis-print - I meant V3.6 :-(

SS> Cant it be installed from the dektop, i'm sure it can?. BTW, Have
SS> you tried freedom yet.
No, I believe it has to run from an AUTO folder. Haven't yet tried Freedom, though I've got it. Till now I have been happy with Selectric, and it uses up less memory.

In a message of <15.09.97>, robscha@data.rhein-main.de (90:102/0.99) writes:
r> Stop that! It's a chance to loose the hole mainboard!
r> Do not contact evrything on the pcb to earth! (What a risk!!)

Hi Robert!

Thanks for your advice. However, I am making the earth contact via a /very/
high resistance - 50,000 ohms per Volt on a 300V range means
15 Megohms, which I don't think can do any harm.

r> But sorry, i don't have a ciruit diagram of that type of psu.
r> Some other internal atari psu's are neary the same.
r>
r> So i will have a look to the old psu from a 1040 STF :
r>
r> R8 is a safety resistor with 1 Ohm in line to a Transistor BU508
r> (Q2), the driver of the pimary side o the transformer. I think your
r> psu lost his primary clock.
In my case R8 is marked and measures 100 ohms. It is next to Q2 so I think
you are right about it's purpose. I don't know how the primary clock works -
is it used just to start up the switch-mode working? Because as described
below, once started the psu works fine!

r> Check R4 (330 Ohm, 2 Watts)
r> If that resistor OK check Q1, 2SC1384.
r> Check D1, BYV95A
r> Check PC1 (SHARP PC817)
r> Check Q3, TL431 (TexasInstruments)
r>
r> Check R1, 5D-11 (NTC)!
I'll do that when I put a replacement supply in which a fellow club member is
loaning me.

r> Check DB1 ~ and ~ are 120V AC IN
In my case that would be 240V :-)

r> + and - are 120 DC OUT
I take it you mean 12V here. I think it must be, because the computer is
working fine once started. It's just that it won't start up when power is
first applied!

r> C4,C5 (both 47uF/250V) must have around 150VDC and more!
Again will check this later. Problem is that I understand that a switch-mode
psu must have a load on it before it starts up. I'll try and rig up a dummy

load of suitable bulbs.

r> I hope you found the parts on your pcb. If not, you have another
r> psu! Do not touch anything on pcb while the psu is pluged in!
r>
r> Don't touch the heat sink!
r> It's more as 200 V on it..
So I've read, but in my case the meter shows 0V on both the heat sinks while the computer is running - that is measured to true earth.

r> If you can't found any defective part, replace the psu.
r> (A chance you lost the transformer..) (To expensiv, get a new
r> one)
Yes, as a last resort I will. But I doubt if it's the transformer as otherwise it surely woudln't work at all? Peerhaps one of the transistorts has gone low beta or something so does not staert oscillating, but can be kicked into doing so?

Regards
Peter

Message-ID: <6016d3$734@freenet-news.carleton.ca>
Source record: 116547

I just got a good deal on a TT030, the King of Ataris, but I'd really rather have the Prince of Ataris. The TT has; 19" mono monitor, 4Megs ST, 4Megs TT RAM, 350Meg internal SCSI, Pagestream, Atari Works, NVDI, HDDriver, Touch-Up, Imagecopy, Home Finances, much more (latest versions in all cases).

I'm looking for a Falcon with =>85 internal, pref.16Megs RAM, Cubase Audio, etc.

If you've got the music machine and would prefer the DTP monster, get in touch!

Alternatively, I'd swap my MegaSTe + goodies for the Falcon.

3696. Help me with internet connection

Newsgroup: comp.sys.atari.st
Date: 1997-09-20 00:00:00 UTC
From: Andrew Chatfield <Andy@TimeSlave.demon.co.uk>
Message-ID: <01bcc5e6$fe2ddde0$69e7dec2@Andy.timeslave.demon.co.uk>
Source record: 116551

Hi There,

I am currently about to purchase a standard Atari 520ST and I would very much like to use it to
access the internet.

Could anybody tell me whether this is possible and give me a list of everything that I would need
to buy or/and download to get myself up and running, I really don't know the first thing about how to
go about making this happen.

I currently use a P.C to access the internet but I have to sell it this week, that is why I need
to use the ST for the internet, I have an old 14400 modem at the moment, will it work on an ST or will
I have to buy another one, if so, which?

Finally, I currently have an existing internet account with Demon(U.K), will Demon support an ST or
would I have to cancel my account and go somewhere else.

Thank You for your help.

Source record: 116552

Hi there,

I am currently using a Pentium 166 but I am selling up this month due to finances,
However, I am desperate to keep my access to the internet and I have been offered a standard
Atari 520ST at a bargain price, I am hoping that my prayers may be answered.
I would be eternally grateful if someone would answer me the following questions:

Will this ST be usable on the internet and if so is it feasible to do so?(will it run fast enough?)
Can I keep my existing P.C internet account for the ST?
How do you download on a 520ST, they have no hard drive
If it IS possible to use this machine for my internet needs, could someone give me a comprehensive
list right from scratch comprising of everything that I would need to have to get up and running
(software/browser/leads etc.)
Can I use my existing P.C modem on an ST?

I hope someone can help me with my predicament

Thank You andy@timeslave.demon.co.uk

A standard 520ST only has 512K of memory, and will not get you very
far. If it has at least 1M, then you can play.

>Finally, I currently have an existing internet account with Demon(U.K),

FALCON BASED DIGITAL AUDIO RECORDING SYSTEM

In excellent working condition. Check carefully for the items. They are good and the best on their category! This system works fine and you will be able to produce your music in the digital domain. Whether sequencing or audio editing, it performs fine.

1. Falcon 030 with 16 MB RAM. All required Steinberg audio & timing fixes have been done. Line level audio in.
2. 2.5' 60MB IDE Hard disk
3. Wizztronics DEKA interface for using external keyboard
4. Honeywell keyboard
5. Beetle mouse
6. SCREEN BLASTER II (for higher screen resolution)
7. Wizztronic Cart Master LIte (allows plugging in two cartridges at once) (for Cubase and Zero-X)
8. Monitor adapters for VGA and Atari Monitors.
9. Steinberg FDI (DSP PORT Digital interface for digital recording: DAT; CD, etc.!!)
10. External 1GB SCSI (no thermocalibration) Seagate hard disk.

SOFTWARE:
(all are original disks & include manuals)
STEINBERG'S:

1. Cubase Audio V2.06
2. Studio Module
3. Cue Trax
4. Style Trax
5. Data DAt (for backing up files to DAT)

---

6. Zero-X (Superb sample editing program)
7. BAnd-In-The-Box
8. ExtenDOS PRO 2.4a (CD-ROM driver with direct CD record to hard drive)
9. HD Driver 6.0 (Best Hard Disc manager for Cubase Audio)
10. ICD SCSI PRO Utilities 6.55 (covers things not handled by HD Driver)
11. XBOOT (Wonderful program launcher)
12. Diamond Edge II
13. Diamond Back III
14. Steno
15. Stalker
16. Image copy 4.0
17. CD-ROMS & MORE software.

Price: $ 1350 OBO. Repply to fpinto@byu.edu for more details. I rather sell the entire studio to one buyer. Phil.

The latest version I'm aware of is v5.04 (Dutch version). I don't
think it's further supported now.
V5 is much alike "That's Write". One could say it's the same but with
another name.
In the past it was distributed by Compo Software but AFAIK Compo
is out of business now.

Source record: 116557

Hi there,

I am currently using a Pentium 166 at the moment but I am selling up this month for financial reasons,
however, I have the chance to buy a standard Atari 520ST for what I regard to be a very low price,
even though I am selling my P.C I am desperate to keep my internet access and I am hoping that this
may provide a good, cost effective solution.
I have owned an ST once before, but this was long before the Internet was up and running, so I would
be extremely grateful if anyone could give me the answers to the following questions:

Would it be both possible and feasible for me to use this ST for access to the internet?

If so, how will it perform on the net, is it worth my while?

I have a current internet account on my P.C, if I use the ST will my account still remain the same?

If I use the ST for the internet, could you tell me right from plugging the computer in a list of everything that I would need to gain access to the net (software,browser,equipment etc.)
I am currently on an old 14400 modem,
will this work on an ST?

Finally, how would I go about downloading information onto the ST as it doesn't have a hard drive.

Thank you

andy@timeslave.demon.co.uk

I just sold my old atari ste with 4 megs. One disk that i had enabled me to load up GEM 2.6 as a replacement shell, but when ever you launched a program, it would drop back to TOS 1.62 (which was in ROM). If you are interest in getting this program, email me...

I'm well aware of your attitude re. piracy Tony, but this is pure crap.
We're not talking about "stealing" here, nobody is selling these games
anymore. In fact, if you call any of the old publishers of ST-games
(Gremlin, Psygnosis or whatever) and ask them if they have any games to
sell you, they will probably just laugh in your face.

As I said, these games are treasures, and should be conserved. I can't
imagine any better way than to put them all on CD's and give them away to
anybody who wants them.

A couple of months ago I bought a CD with thousands of C=64 games. Many of
them are newer than most of the classic ST-games, and the CD only costs
£6,- There are several similar CD's available for other 8-bit computers
and consoles, and I believe that it's time for a similar compilation for
the ST.

Unless somebody else does it, I'm going to start collecting
Automation-disks and make a CD, nomatter what what you or other moralists
says. Spend your money on new and modern software instead, you're not
helping anybody or the ST-community in general by wasting them on old and
unsupported games.

3712. NEWSwatch 1.00 released

Newsgroup: comp.sys.atari.st
Date: 1997-09-20 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <95921986_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 116615
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

NEWSwatch v1.00 is now available from my web site!

NEWSwatch can be used in conjunction with STiK, and Oasis1.3x/Snews or
Oasis2 to send and receive Usenet news articles.

It's similar to POPwatch in that it replaces the online parts of NOS and
Oasis2/ICE, with a STiK compatible interface.

So if you use Oasis2 or Oasis1.3x/Snews and have always wanted to use their
news facilities with STiK, you now can :)

Please let me have lots of feedback!

Regards,
Gary

Try this out. It's a modified version of a ramdisc that I saw in a very
old ST magazine (could have been ST World, circa 1987).

The source code (devpac 2 assembler) is included in the zip, so you can
modify it's default (almost 2Mb).

BTW, it installs as drive M: and, by entering a size at the command line,
it can be varied.

It's had a call to mxalloc used, with a preferance for TT ram, instead of
it's origonal 'free the space that I don't need and stay resident'. This
means that if there's not enough TT ram free, it will try from ST ram
before giving up.

As an afterthought, have you tried RDE? I'm not sure but I think that may be
TT compatible.

This MIME-Encoded message was created with ESS-Code 6.1, for the
Atari (Mega) ST(e)/TT. The same utility can be used to decode
this message, or the MUNPACK utility (UNIX, IBM, Amiga, & Macintosh)
can be used.

>but graphically spare - why not have all the links on the first page?

I understand well the problem, my advice is; yes it can take a lot of
time (though the link pages are not very overloaded with graphics ...
only the new logo !) but when connecting for the second time to the
U.T.S.I your disk cache must allow not to download the whole thing !!!
What about that ? When I connect regularly to the U.T.S.I I don't need
to download all these graphic stuff ... CAB only loads the texts and
tables again ...

>I know that I could easily turn off the graphics in CAB, but the first
>time in, I didn't realize that it would take so long. In TT medium
>resolution, just about any background image, when dithered to 16
>colours, makes whatever text is in the foreground unreadable. Since
>this is an Atari page, why not make it more Atari friendly?

I don't really understand, because a french user just said me the
contrary about using my pages in 16 colors, nevertheless I will verify
the pages in this mode :-)

The U.T.S.I are made exclusively with Atari programs ... I don't own
any other computer :-) So I think the pages must be Atari friendly :-)

Jo

As you already know I use CAB 2.5, Everest, and the wonderfull Penguin
to build may pages ...

Remark that is not at all the case with U.T.S.I pages ...

> If its an ATARI page then it should be "Easily" accessible using an
>ATARI ST with CAB in medium rez...at least!

This is the best idea, I will then try that as soon as possible to see
what is possible to edit to keep the pages as original as they are !

> You can make a page fully ATARI accessible and nice to view, and
>check it out in CAB using high rez as well,lots of people have that
>type of setup...

This is right, only one thing though, surfing with an atari is nice,
but for sure, it's more pleasant to use 256 color mode when beginning
to browse web pages ... very little amount of web pages are yet done
to use with a 16 color system or even a B&W system ...

3721. 520ST Floppy Problems (New ST User)

Newsgroup: comp.sys.atari.st
Date: 1997-09-20 00:00:00 UTC
From: drd1207@unix.tamu.edu
Message-ID: <drd1207-2009970109170001@modem-1279.rns.tamu.edu>
Source record: 116624

I was recently given an Atari 520ST by a friend of mine who moved. I would really like to do some assembly programming on it (I have a strange love of old 68000-based machines). However, he had already told me that he had problems with the floppy drive not wanting to work (this is an external, single-sided SF354 drive; the ST has no internal drive). I saw it working about 6 months ago, and he said he got it working just by banging, dropping, and other assorted methods. From what I have read, this is a fairly common problem on older STs, I believe due to the floppy controller coming out of its socket over time. I attempted the simple fix to this problem (the 4" drop), but to no avail. I have plenty of bootable ST floppies (and my PC FDD can read the single-sided disks), but no way to run them. The exact symptoms are:

Power On: Drive light flashes, then stays on steadily. The drive spins at a regular interval (I can hear it). The screen stays white for a long time, then the desktop comes up. If I try to open the floppy drive icon, it says the drive is not responding. Meanwhile, the drive light is still lit, and the drive continues to spin forever, as far as I can tell.

I would really like to get this working. I opened it up to try to see if all the chips looked properly seated, but I had no idea which chip was what, though the ones I saw looked OK. Would this affect a hard drive? I've thought about getting an HD, but it would already have to be formatted, with at least a comm program on it to get anything onto the computer. If worse comes to worse, I will just ship it to someplace that does ST servicing, but that would take a while, and I would rather fix the problem myself, if possible. If anyone has any ideas, please let me know. Thanks.

Hi,

As it is a Atari page please keep in mind that not everyone is
using a TT with graphic card or a Falcon . Lots of Atarians use 8 bit
machines with a monochrome display and 14.4 modems. Have you any idea
how long it takes to download all these big graphics and sound files
on a 8 bit machine with a 14.4 modem?

Coloured tables are very nice but viewed on a monochrome
screen it can be very disastrious especially when you use white base
text color in conjunction with a pale color. For instance: In the
PRG.COMM.htm you defined the body text "#FFFFFF" and the description
column in some kind of blue () Now
if you view this on a monochrome screen you will see that the second
column is displayed in white and as the text is also in white... Do
you get the picture? Use for body text "#000000".
I know you have a TTM194 screen so why don't you use this to check the
global appearance of your creations. Don't use the monochrome display
of CAB on a color screen. It isn't the same. You really must use a
monochrome screen.

Also keep in mind that some prefere to use text based browsers
like Lynx. That's another reason why you should use graphics
sparingly.

Furthermore some guys are using old version of Netscape and
Micro$oft Internet Explorer. These versions doesn't support coloured
tables. So the tables are displayed with the base background
picture/color setup.

BTW: Don't take this to serious will you. You're doing a great job
afterall but you've ask some comments...

wrote:

>> Support software piracy if you want to Roger, but NOT behind an
>> excuse, Piracy is Piracy.. no excuses :(not from anyone,
>
>I'm well aware of your attitude re. piracy Tony, but this is pure crap.

No you are not..... I am NOT saying don't do it?, you simply are not
following the thread of conversation here, I am simply saying that if
you want to be a software pirate then be one,But don't try and say its
for some helpful reason, its two faced, software piracy is software
piracy, no matter how you or anyone else dresses it up,
If you want to do it then go ahead, As I said, it will not effect me
:), all I say is that you should all at least be grown up enough to
admit to software piracy and not some of the lame excuses you are all
putting forward...

>We're not talking about "stealing" here, nobody is selling these games

WRONG... try reading the for sale adverts in this newsgroup... how
can you say no one is selling them when there are adverts appearing in
this group selling software.. I don't understand?

>(Gremlin, Psygnosis or whatever) and ask them if they have any games to
>sell you, they will probably just laugh in your face.

We are not talking about companies... stuff them :).. I am talking
about fellow ATARIans who have obtained there software legally with
there money, the value of there purchases goes to nothing if you take
it upon yourself to give it all away..
AGAIN..this was not my point, my point that you and Roger Cain who I
originaly answered to, and some other well known ATARIans are trying
to make excuses for supporting software piracy....thats my point!

>As I said, these games are treasures, and should be conserved. I can't
>imagine any better way than to put them all on CD's and give them away to
>anybody who wants them.

Excuses...for software piracy...

>and consoles, and I believe that it's time for a similar compilation for
>the ST.

So its alright to rip off the honest ATARI community because you
think its time ?....hmmm

>Unless somebody else does it, I'm going to start collecting
>Automation-disks and make a CD, nomatter what what you or other moralists

hahahaha, what on earth are you talking about?.. everyone is doing
it, every single pirate compilation ever made is readily available for
download of the internet, you missed the boat, there already out
there,
AGAIN my point was NOT doing it, my point was the lame excuses you
and your supporters come out with,

I know software piracy will not go away, I know people will be
swapping and giving and releasing cracked games.. HEY! I even
understand where your coming from and why you are doing it and in some
respects agree with you,

BUT DONT DO IT BEHIND A LAME EXCUSE, IF YOU WANNA BE A SOFTWARE
PIRATE THEN CALL IT THAT...

>says. Spend your money on new and modern software instead, you're not
>helping anybody or the ST-community in general by wasting them on old and
>unsupported games.

HAHAHAHA I think a hell of a lot of tempest, dungeon master and all
manner of game players will dissagree with you there,

BTW what support do you want in a game ?....sheesh :)

>Jo Even Skarstein

BTW a smile here and there wont hurt, its just a debate, not a war :)

.

Nostrodamus phrophesised this from firebird@wildnet.co.uk to All...

Hi Graham!

f> Organization: Transatlantic Creations

f> Once again I seek help with printing colour pictures with Papyrus 5
f> :)
f> I've upgraded to NVDI version 4.11 installed it and ran Papyrus 5.
f> Everything seems to be fine when printing but here's the funny
f> thing,all I get is any text in the document printed and still no
f> pictures!
I've got the print buffer set to 2048Kb and (under "compatibility") "Use
memory.sys".

This has stopped Pap from crashing when it encountered a colour image.

HTH.

Speak to 'ya later!

3727. Searching for a SpeedoGDOS editor

Newsgroup: comp.sys.atari.st
Date: 1997-09-20 00:00:00 UTC
From: DCroker@fortress.org.uk
Message-ID: <1450_DCroker@fortress.org.uk>
Source record: 116630

Nostrodamus phrophesised this from curis@vedette.ens.fr to All...

Hi Emmanuel!

c> Organization: ?cole Normale Sup?rieure, Paris

c> I search for a SpeedoGDOS font-editor, if possible freeware
c> or shareware. Does anybody know where I could find one ?
There isn't one I'm afraid. Bitstream won't divulge the format of their font files so no-one has been able to program a font editor.

About the only thing that you can do is to convert Speedo fonts into Calamus CFN font files and edit those, but of course you cannot convert them back.

Speak to 'ya later!

No, I've use the ICD software and have got it from a bare machine, ie
just magxboot and the icd stuff. I'll have another play with the
MAGX.INF file but I'm not holding my breath. Any one else have this by
any chance?

ALaN.

I use a 28.800 baud modem, it works just fine with HSMODEM7 and the
SERIAL.CPX from the STiNG pac. instead of the original MODEM.CPX.

I have no, experience with higher speed, but some others I know of
use it with great success.

cheers

> of text.

I could be wrong on this, but I think that any GDOS variant (including
NVDI) will only print complete pages, which is why you can't normally
interrupt printing part way through a page when printing out from GDOS
programs. So if you use a Papyrus driver (the supplied BJ10 one is
useless without editing, BTW - stick to NVDI!) you can abort printing
and it will stop immediately, but if you use NVDI/GDOS you can only
abort after it's finished the current page.

>-I can't see any real difference between 180 and 360 DPI. I thought this
>was the print quality (180=economy mode, 360=final copy/high quality).

No, it's really what it says: resolution. However, having just tried
the NVDI BJ10 driver set to 180, I'd leave it alone as it makes a real
mess of graphics (quadruples the size of them so you only get the top
left corner of the page but magnified, with normal size text printed
in the right place: horrid!). 360 works fine and doesn't use any more
ink as far as I can tell (I suspect it uses more memory and takes
longer to generate the bitmap, though).

>I can see a big difference when printing text bypassing NVDI, by pressing
>the "economy/HQ" button on the printer priot to printing.

The economy mode only works with direct text printing, AFAIK. It uses
half the ink as it only uses half the jets, so it's sort of 180 dpi.
However with graphics printing (and all GDOS output is graphics
output) 180 dpi just makes the dots bigger, rather than using fewer
jets. Doesn't make it lighter, just grainier.

>-I've tried opening ASCII files for reading using "ST-guide" which I've

>2
>3
>4
>5 ON
>6
>7 ON
>8
>9 ON
>10 ON
>11
>
>(the rest is ofcourse in the OFF position).

This is an extended ASCII problem. Ataris put your two characters on ASCII 179 and 178, which map to the | and grey square in code page 850. Code page 850/character set 2 (as you've set up with switches 5 and 9) is expecting ASCII 155 and 157 for these characters, which the Atari helpfully uses for the Cent sign and the Yen sign (NB I'm not sure if Norwegian TOS is the same here). I tried switching to Epson mode and setting it to Danish characters but that failed too as it's then expecting them on ASCII 124 and 92! Did you have this working OK with the Panasonic?

The only way round it that I could find was to use Everest with an Atari-coded screen font (eg Monaco or one of the NVDI monospaced scalables) and print out via NVDI/GDOS using a suitable monospaced scalable. If you use a non-Atari coded screen font (eg the CoNnect fonts) the screen will show the pipe symbol and grey square but GDOS printout will be OK.

One other possibility would be to use some kind of print filter which will translate the codes as you print. I think Harlekin had something like this back when I used to use it, though what effect it has on graphics printing I don't know, as I kept it switched off.

If it's any consolation, we in the UK have similar problems trying to print pound (as in UK currency, rather than weight) signs, though it's obviously not as critical as it's not cropping up in every other word unlike a main alphabetical accented character.

Sorry I can't be more help.

TTFN
John

Are you tough enough to say that in a court of law ??

>Let me just point out that I'm *not* supporting piracy of software that's still
>sold or supported!

That is a bad thing to say. It is IMPOSSIBLE for you to know what games are still on the market in every computershop in the world. Therefore its better to say NO to pirates at all times. I myself was pirating ALOT in younger years (I know lots of people in this area know that), but i have at last come to senses and is now bying all my soft and hardware.

> I know that a few old ST-games are still sold by 16/32 Systems,
>I'm not going to put cracks of these on a CD and distribute them!

You can if you ASK the authors promission.
Its not that hard is it..

On 20 Sep 1997 14:16:10 GMT, in comp.sys.atari.st you wrote:

>comp.sys.atari.st wrote:
>^^^^^^^^^^^^^^^^^
>(You should fix this)

No I shouldnt, I post to a public forum to talk, debate and help in
public, I do not reply to private email resulting from public posts,
I also do not hide my email address as both are in my sig :)

>sold in the shops for ages.

not the shops no... but look at the postings since you first said in
here that no one selling games, there have been a few honest ATARI
users selling legal copies of games,
ATARIans are selling games legally... so your argument that no one is
selling them has been proved null and void a few times this weekend
alone!

>I'm NOT supporting piracy of commercially alive software! IMO there is a

I know... and thats why I conceded that I can see where you are
coming from and can see your reasons and can agree to a certain
extent, I already agreed with you on this point, so hardly worth
labouring it?

>So piracy is fine by you as long as the pirate admit that he actually *is*
>a pirate? OK, so I'm a pirate ;-)

NO...:)...Piracy will never go away, people will copy, I aint on no
crusade... I already pointed out it wont harm me and I dont care what
you do.. I just take offence at people ripping off fellow ATARIans and
calling it something good,
YES you are ripping off every ATARIan that has posted a for sale
message this week, and every ATARIan that will, or may want to post a
for sale message in the future,
You are ripping of the Public Domain libraries who have supported
ATARI for many years and now trying to subsidise by selling legal game
collections,
YOU and your supporters are ripping off all these honest ATARI
people,

OK thats life.. these things happen, we all know that... but what a
cheek when you rip all these people off AND tell them its for there
own good..?...If you look back you will see that I entered the thread
on that point, not on the piracy issue as that is a whole different
debate thats been... eerrm :) debated to death..:)

It makes it worse when otherwise respected well know ATARIans post messages saying yeagh yeagh lets copy all the games, but lets call it presevation then no one will moan :(...Thats lower than being a software pirate IMHO...

.

>but for sure, it's more pleasant to use 256 color mode when beginning

Thats NOT the issue though is it, we all know more colour, faster
modems and powerfull machines are better, but you are offering a
service to ATARI users so should aim your page to be fully ATARI
compatable,

>to browse web pages ... very little amount of web pages are yet done
>to use with a 16 color system or even a B&W system ...

ATARI ones are.. for ATARI users...Mine is....People comment that my
page looks nice, and I personaly test it in all ATARI resolutions, yet
I personaly use MIE3 and a 33.6 modem, But as my page content is aimed
at ATARI users then I make damm sure its a pleasent, fast and easy
place to visit :)

.

Out of the ether, the following was mentioned by bdc2@po.CWRU.Edu...:

b> I have an Albertt card that works, but sucks. Does there exist
b> a decent board for a TT, and where can I get it? Does anyone have
Well I have a Matrix TC1208e which is a pretty decent card (fits
completely in the VME slot, does 1280x1024 in 256 colours or 832x624 in 16
million colours or practically any combination in between
without any noticeable slow down) the only problem being its new
price. System Solutions in the UK sell them for 999 UKP which is a lot of
money whatever the currency!

I was lucky and got mine second hand but you don't tend to see to many for
sale.

b> Where can I buy one? How much do they cost. I have a good NCR
b> digital 17" multisynch monitor to use it with.
I use a CTX 2085 multiscan monitor, main reason being the larger
screen area is handy when running in big rez's.

There are a number of other cards, but I don't have any experience of them.

Out of the ether, the following was mentioned by SSweet@fortress.org.uk...:

l>> Is it, as System Solutions claim, "twice as fast as a TT"?
S> Judge for yourself.
Amateur! ;-)

My non-accelerated TT rates as 4 times faster than a TT (it manages 1121n
CPU but with NVDI and the graphics card rates much faster for video!)

Now my Falcon rates almost 20 times faster than a standard MegaSTe, but thats
another story...

: I hope this isn't a silly question !

Modems can compress and uncompress data. Text files can compress quite a bit, whereas a .gif or .zip file that is already compressed data will not compress down much further (if at all). Therefore, you get higher "cps" counts for compressable data.

Just a guess, but it sounds as though your HD boot-sector has gone
unreadable. You just need to re-install it from the floppy containing
your hard disk driver. The procedure rather depends on your HD
software but normally you would boot up, run a copy of the HD driver
from the floppy then use the utility which comes with the driver to
"Install" the driver on C: which will re-write the bootable sector.

Then how come there's people on this newsgroup, not counting many others
who aren't, still using ST and variations of the platform today? Atari
may have went under a few years ago, but people are still playing freaking
2600 games for crying out loud. Crap, why even make a ST emulator at all
if it's "dead"? I think 'orphened' is a more apporiate term. :)

No, a lot of people get confused over this!

You are getting a connection with your host which allows data
compression so text files are being compressed, sent down the lines at
14k4 and then decompressed by your modem. As you see the compression
ratio is a little over 2x - this is quite normal.

The other kinds of files you mention are probably unable to be
compressed very much - they may be archive files which are compressed
already or data which does not contain (i.e) sequences of repeated
characters.

Source record: 116510

: >Currently I am using a 14.4 modem with my Falcon/Cab/Stik setup.
: >Is anyone surfing with a Falcon at 28.8? 33? 56? Please let me know
: >your experiences and what the fastest modem I should get for my
: >setup. Does the brand of modem make a difference with Cab?

Yes, I'm running a US Robotics Sportster 33.6 modem on my Falcon.
I've the Falcon's modem port running at 57.6 with no problems.

My provider's modems are set to max out at 28,800, and this is the
connection I almost always get...once in a blue moon I get a slower speed
of something like 26,400.

I can't seem to get this modem and my Falcon to do well with the higher
port speed of 115.2, as I get lost characters and such...this could
be the modem itself, or that "my" Falcon doesn't like that fast of a port
speed. Do I really need a port speed of 115.2? If so, any tips on
testing my Falcon and getting it to do it?

Personaly, I know I'll be waiting awhile before trying a 56k modem.
Currently there are at least two different protocols competing for
market share...few providers carry either one...and even if they do,
some phone lines can't handle it anyway! In fact, in my area, the
reason my provider put a 28.8 celing on his 33.6 modems is because we've
so many old analogue phone circuts that end up kicking the modems back
to much slower speeds anyway.

But, to answer your question...YES...you can use fast modems on your
Falcon. No, brand doesn't matter so long as it's an external job with
standard RS232 connections.

: >Is there any way to test the throughput of the modem with Cab other
: >than to watch how fast the bytes come down the line? (holy
: >inaccurate methods batman!)

I'd like to know this as well!

: >I have read in a PeeCee modem forum of
: >many users of 56K modems trying to connect with 56K servers and
: >maxing out at 33K!

Very true...usually because of the phone lines.
Save your money on the 56k thing for now. Most modems can easily be
upgraded to future protocols, and you could end up like me, and buy
the modem with the protocol that WONT be supported by your ISP because
they're looking at the OTHER one. Also, note that the 56k only works
one way...on the download...the stuff you send is at much slower speeds.

I thought # 35 meant there was something wrong with the program, such as a
corrupted file or RSC not found, etc.

If your modem uses compression (probably does) then its compressing the
text files as it goes along. The modem is actually only recieving 1600
bytes per second, but compressed data equals 3000 cps. If you download a
zip file or gif or jpeg, those files are already compressed and the moden
can't compress them any further.

If you can get a text-only connection it will work very well. You'll need
a terminal program. I use Freeze Dried Term to surf the net without
graphics. Not as pretty as a 166Mhz PC, but you can get around on the net
much faster in text-only.

> I have a current internet account on my P.C, if I use the ST will my
> account still remain the same?

That depends. If its a PPP or SLIP connection, then a 520ST will probably
not be able to run the ST browser software. No prob with a 1040ST.

> If I use the ST for the internet, could you tell me right from plugging the
> computer in a list of everything that I would need to gain access to the
> net (software,browser,equipment etc.)

See above.

> I am currently on an old 14400 modem,
> will this work on an ST?

Your modem will work fine. Just select 19200 as your baud rate in whatever
software you use.

> Finally, how would I go about downloading information onto the ST as it
> doesn't have a hard drive.

You'll just have to download to the floppy.

Download the ftp server from my web page, it has quite a sensible mechanism
to provide security. Sure, for a telnet server the issues to be addressed are
not exactly the same, but it might give you a starting point.

Some things are mixed up here. That guy described a trick that works with
SLIP only, while you're referring to a bug that you'll see only with PPP.

Well, I inventoried all my Atari stuff and have quite a list. Browse through, take a look, and let me know if there is anything you would like. Here goes....

HARDWARE:

PCM124 Atari PC Monitors-NEW-$30ea.
NX-1001 NLQ Star Multifont Printer-multi paper path, auto loading,prints on up to 3ply paper, original box, like new.-$30

A/B Video BOX(NEW) - 3-15 pin female jacks - A-B & Input-Output-$15 above with 2 new 15 pin male video cables-$25

SC1224 Monitors - units power on and have displays but all need different types of repair. Ask whats available. $10ea.

KEYBOARDS for Atari ST/STE(Not MEGA)-good working condition, clean, no broken keys.-$10ea.

Oivetti Ink Jet Printer Model PR2300. Includes 20 ink amples and AXIOM 32K Wordstore Printer Buffer. Original Box and docs. $20

NOW FOR THE SOFTWARE.......

UTILITIES-Business-Education- "ALL CONTAIN ORIGINAL DOCUMENTATION & BOX" ** Atari CD's **
TITLE Manuf/Dist Description PRICE

Hard Disk Sentry- Chromagic-disk repair, optimization utility for ST/STE/TT & Falcon030.-SOLD (new-shrink wrapped)

PAGESTREAM Release 2.2SE-Soft Logik-Atari Desktop Publishing Program-47 fonts, 100 page manual.-SOLD

PAGESTREAM ASSISTANT for Pagestream-Spar Systems-ST/STE/TT Falcon. Hypertext personal guide.-$10(shrink wrapped)

THE MUSIC STUDIO-Activision/Audio Light-music program, includes 7 music floppies.-$5

LOTTO DDS-Missionware-Lotto number generation program and lotto database manager.-$5(shrink wrapped)

FLASH II-Missionware-V3.00-Telecommunications/modem software for ST/STE & TT.-SOLD

ATARI CD MASTER 4.(includes Audio CD Master)-CD Rom access software-HOMA House Canada-Drivers for the following CD's-Infopedia v2.0, Time Almanac, UFOII, SpaceMissions.-SOLD

Atari FIRST WORD Wordprocessor-SOLD

EXTENDOS PRO-Anodyne Software-v2.1-for ST/STE/TT/MEGA's & Falcon-CD Drive driver-auto install/enhanced audio player-support for over 40 CD-ROM drives & more!-SOLD

DATA DIET v1.0-Disk drive compression program-Double Click Software.-$5

MOUSE BOOT v3.d-Boot manager-$2

ULTRA SCRIPT-Atari-A PostScript language compatible interpreter features Lucinda font family for MEGA's & SLM804 Laser Printer.-SOLD

MULTI-DESK-Codehead-unlimited desk accessories utility.-$2

PHOTO SHOW PRO-STE v2.3-Its All Relative-Kodak Photo CD application for STE & MEGA STE.-$10(incls. Winning Pictures Viewer & PhotoKina CD ROM viewer drivers)

READ-A-RAMA-Unicorn-ages 5-8-Learning activities-$2

FUN SCHOOL #3- DATAbase-Education software-ages 5-7-$5

TYPING TUTOR-Word Invaders-Acadamy Software-learn to type on your Atari.-$5

REGENTS WORD II-Regent Software-A GEM based word processor w/Spelling Checker-$2

*** CD's ***

SKYLINE CD-SOLD
CRAWLY CRYPT VOL#1 CD-SOLD
CRAWLY CRYPT VOL#2 CD-SOLD
THE ST SOFTWARE LIBRARY-D&C Enterprises-150MGS of Public Domain-one of the first Atari CD's-SOLD
ATARI MEGA ARCHIVE VOL #2 CD-SOLD
ATARI GEMINI CD-Walnut Creek-SOLD
STE POWER CD VOL#1-SOLD
SUZY B's SOFTWARE TREASURY double CD ROM Set-SOLD

QUICKFORMS CD - Sterling Connection-requires Pagestream for forms and layouts(any version). 5300 clipart img/iff-ilbm format. 550 type 1 fonts. 110 spreadsheet templets. 190 gif 140 PI1(degas) 722 postscript clip art images. 160 gdos 140 pagestream 230 calamus fonts. 700 business letters in txt format. Utilities for printing a viewing files.
Includes Templicity, LogoLibrary, Cliptomania I&II, Font Farm I & II, and ClassicWare collections. Includes all docs. $25 for the CD.

CLIP ART COLLECTION CD-Electronic Spinster Graphics-for Atari Computers-over 6,000 clipart images in IMG format-1,000 vector images in CVG & GEM/3 formats.-SOLD

*ALL CD"S IN EXCELLENT CONDITION **

GAMES GAMES GAMES GAMES GAMES
All have original box and doc's!!!

MAH-JONG Solitare-Cali-Co Software-Chinese Tile game-excellently done for the Atari, one of my favorites-SOLD

DOG FIGHT-Micropose-80 years of aerial warfare-flight sim-$10

CHESS CHAMPION 2175-Oxford Press-excellent chess game,-SOLD

OBSESSION-Unique Development Sweden-excellet pinball games-for STE only.-$15

R/C AeroChopper-Ambrosia-Remote Control flight simulator-fly helicopters and fixed wing aircraft. Comes with an original FUTABA Conquest four channel/2 joystick R/C controller that plugs into the Atari. Comes with manual-software & original box-excellent program for a 1-meg Atari.-$50

NAME YOUR PRICE ON THESE GAMES SW=shrink wrapped
All come with original box and doc's!!!! *Commercial Software**

>compatable,

This is a excellent point of view, I must admit it ... :-) But what i
think about is more subtil; let's read the following lines:
In my humble opinion, and after just one year of internet pratice, I
have not seen a lot of atarists surfing on the net with Atari
computers ... and in France THIS IS A FACT ... only a few people are
using Atari computers on the net, excepting a few rare 'birds' who own
like me TT with graphic card which cost a lot of money (happily I
have bought all my atari computer stuff in second hand !) NOBODY seems
to use the net graphic capabilities with a 1040 ST black and white
monitor equiped ... except perhaps for the usenet ...

Nevertheless a lot of people are trying to use Falcons to go to the
web side (not site !:) but they quickly remark that the nice bird is
so slow to show web pages ... a friend of mine simply refuses to
connect to the net with his Falcon because of the speed ...

Just look at the article headers in this news server and you'll
understand what I exactly mean ... This is a kind of suicide to
connect to the net with an Atari just right now ... PPP Connect don't
work and MintNet is a true headache to use ... I have the exceptionnal
chance to have built my connection with the help of a dutch friend
who has becomed a SPECIALIST in atari web connecting ... without him I
should never have any chance to be here right now ...

PEOPLE ARE CRYING TO RECEIVE HELP TO MAKE A SIMPLE CONNECTION WITH
THEIR ATARI ... JUST LOOK AT THE ARTICLE SUBJECTS RIGHT HERE !!!

We are speaking together via at least one IBM compatible ... I'm
almost sure you are using one :-) Isn't it ?

>>to browse web pages ... very little amount of web pages are yet done
>>to use with a 16 color system or even a B&W system ...
>
> ATARI ones are.. for ATARI users

I think you are totally wrong this way, just read the lines above ...
People complaining of my atari web pages often are Netscape or
Internet Explorer users ... believe it or not ...

>...Mine is....People comment that my
>page looks nice, and I personaly test it in all ATARI resolutions, yet
>I personaly use MIE3 and a 33.6 modem, But as my page content is aimed
>at ATARI users then I make damm sure its a pleasent, fast and easy
>place to visit :)

I give you my best congratulations about the way you work, in fact
it's really something very unselfish and I must applause for that.
I have no excuse about doing it another way, only think about the way
I have choosen ... it's not more complicated than that ... :-)

And now we must surely speak about the future, the atari lovers future
.. Are you so sure serious atarists will continue to fatigue with
their 1040 on the net ? Me not ! In 1990 I had a 1040 STF (second
hand) which I have upgraded to 16mHz and with TOS 1.4, after having used
it about 4 years with a Megafile 30 (and without about 3 years ..:),
at this time I have had the opportunity to buy a brand new Mega STE in
a very big shop selling not only computers but also and above all food
.. AUCHAN shop was selling a lot of new Mega STE at a very silly
price ... about $250 ... Useless to say that people in my club where
jumping in the shop as fast as their legs permit it ....
After having searched a while for a graphic card (here we are ...) I
found again another second hand Mega STE with a VME Crazy Dots 256
colors and also a 10 Mb ST ram memory expansion coming from Germany ... very
rare stuff indeed ... Having used a graphic card is the best upgrade
you can do for your Atari ... isn't it ? One year and half ago, a guy
selling it's TT030 was interesting me (his computer in fact ...) I
bought it, put the graphic card inside, began to have some interest in
the Internet and you know the rest of the story ...

Do you really think I would have upgraded all this stuff if I had no
money ... in fact I didn't had any money to buy this stuff, but when
searching you FIND and I think, it's the moment to find something
interesting in Atari computers other than a 1040 STF to make an
internet connection ...

Nevertheless, with all the money I have spent (even if it was second
hand material, I shoud have bought some kind of good PC compatible or
Macintosh ... isn't it ?)

I have always my good old 1040, but really when it comes to internet
surfing ... forget it !

Find a falcon at $250, put an accelerator board inside, put the whole
thing in a tower, spend a little money and buy CAB 2.5 and above all
..
FIND SOMEONE EXPERIMENTED IN ATARI NET CONNECTION AND INSTALL MINTNET
!

I must apologize to not have found the exact english worlds for my
french thought and my very bad internet aknowledgment and again I must
thank the only one person who merits it:

Martin Byttebier
Martin.Byttebier@ping.be
who has had the patience
to install and install again
a lot of atari internet connections
here in Belgium and beyond the world frontiers

Nevertheless I have yet a lot to learn and to live with Atari
computers and Martin and you everybody fatiguing with your 1040
trying restless to connect and connect again without any help coming
from outside ... only the c.s.a.st !

So I ask to everyone to be very indulgent with me ... I am not yet a
techno boy and there is very little chance I will come one day ...
So let me work at what I can really do ... nothing less than
TRYING TO DO SOMETHING INTERESTING FOR OTHER PEOPLE.

Yours
Truly

Jo

Ho that will be the 200+ people who have recently downloaded HERO2
will it?... or maybe its the hundreds who will attend the upcoming
ATARI shows...
Or maybe its the people who buy ATARI Computing magazine..thats more
than a thousand there..
My page is ATARI only... nothing much for anyone else as you know
:)... TEN THOUSAND hits this year......so far?
Ok we aint talking amounts as in PC users.... but I think we are
talking slightly more than "Some"...don't you :)

.

It's certainly not too slow for CAB ! CAB works fine on the 8 MHz 68000
machines. But CAB is indeed hungry for memory, you'd need 2 MB at least,
so a memory extension would be a must for that 520 ST, if you really need
to surf. For E-mail, FTP and IRC no extension is needed.

I agree a harddisk is rather appropriate. But I know people doing it with
just a floppy. Not the sort of thing I'd do, though.

I doubt that 28800 bps modems won't work with a 19200 bps interface. It
should be fine, although of course quite a bit of the modem speed is wasted.

Hi,

I have now removed the background pictures from the U.T.S.I ...
..
This should allow Netscape users to read all the texts ... be
aware that some older versions of Netscape don't allow to show
background colored cells from html tables.

The best browser to acces to every graphic U.T.S.I subtility is
without contest CAB 2.5 ... atarists, be aware of that fact !!!

If somebody has found some benefit from this new U.T.S.I
modification, just drop me an electronic letter.

Jo

But please understand that:

(1) Notator SL is sensitive to a number of things. On a Mega STe you must disable MACCELL.PRG, COLOR.CPX and WCOLORS.CPX, as well as the cache, for it to run. It is nice as a music programme but quite limited im page layout.

(2) I have spent a lot of time (way too much time, according to my wife, and she is right) working in Calamus, both 1.09N and SL95, most particularly when I took over as editor of an Atari UG newsletter. When using Calamus, particularly with multi-page documents containing lots of body copy columns, I crave the speed that the Pak30 can deliver.

I therefore hope to be able to just magically return to a stock 68000 config. for Notator, then go to afterburners for Calamus. I think that the PAK30 board will do this, but I really want to hear from someone who has run Notator on it before I proceede with the modification.

I wish to say that I am frustrated buying software and then not being able to back it up and *use* the back-up or not being able to place it on my hard drive and use it from there. I also don't like software that constantly accesses my floppy drive to make sure the original disk is in the drive. (Arkanoid by Imagine Software) Did they ever think about how much wear and tear that does on your drive or on the disk?
I say, crack the games and archive them for the future users and to protect the games from totally disappearing by all original disks being corrupted or wearing away.

P.S. Does anyone have a cracked version of Arkanoid? I'd like a copy. I bought the original disk and play it alot but I absolutely HATE how it constantly accesses my floppy drive to check that the original disk is in the drive.

With a 520ST you can run news, E-mail FTP and IRC, but its to slow and has to
little RAM to surf on the web..

>Can I keep my existing P.C internet account for the ST?

Yes.

>How do you download on a 520ST, they have no hard drive

If you want to get on the internet i must advise you to get a hold of a harddisc
for your ST. You can buy a card call LINK and then hook up any SCSI drives to
your ST. There is also some IDE cards availible.

>Can I use my existing P.C modem on an ST?

Yes, if it is an external one. But if it is a 28.8 modem (or higher) you need to
rebuild your commport on the ST. The commport on the old STs only works with
14.4 modems. But there is a really cheap device you can buy to get this fixed..

Well Jo! There is nothing unlegal about making a copy of your original disk if the copy is for yourself. I have still not found one single original game or program that i havent been able to make a working copy of. I think this is better than CRACKING the game. Because that is surely unlegal.

If the original disc is starting to get bad, then copy it. Or make as a rule to copy your original disc as soon as you bought a new game or utility software.

Cracking is unlegal, and pirates should pay for their damage.

>setup. Does the brand of modem make a difference with Cab?

Welcome to the Club :)

I use a 33K6 Modem (ELSA) since few month. (a 28K8 before)
With both modems i have a fast access to my ISP.
(But you can't have it faster as your ISP is !)

With the latest Beta of CAB i see in the status line of CAB 3500 CPS
as the middle, 5500 at the top. (With PPP-Connect)
Also i got the same speed with STiK/SLIP, but only in night time)

Save your money, nobody use a 56K modem. :->
In some german Mac-Magazines i can read that you are not faster as with
a simpe 33K6 modem. If you got a 56K conncet, it's only while receive data.
Not while send! Send data works allways with 33K6 as maximum.

And you must found a bbs, an isp with 56K..

>maxing out at 33K!

That's correct. Leave it, save your money.
(Or take a ISDN-Line from your PhoneCompany..)

That needs a expensiv modem, but that's faster than a not ready to use 56K mode..

I used a analog phone line with 33K6, that's faster as the web somtime..

Thanks to those who contributed info regarding upgrading my Atari.

I now have two 4 meg m/c's!

When I attempted to use "Profile" to give me the "goods" on my second machine, before I attempted to increase the RAM capacity, the software crashed with a TOS 35 error. I understand this to be a GEMDOS error message which means too many open files. In fact the only item loaded was the "Profile" software.

I ran "Profile" again after my Memory Expansion and got the same TOS 35 error.

Will someone who understands the actual meaning of this error message please relate it me, preferably with little or no "technospeak"

Den

What kind of software do you use for copying games?? I've tried Fastcopy (various versions.), Acopy, Ecopy and lots of other, but there are *a lot* of games that's impossible to copy this way. The only disks I managed to copy without problems was the "Super Pack" games that I got with first ST.

If you want to make a copy of e.g. "Magic Pockets" the only way is to crack it, unless you're some kind of a wizard.

> If the original disc is starting to get bad, then copy it. Or make as a rule to
> copy your original disc as soon as you bought a new game or utility software.

As I said, many (or indeed most) games are virtually impossible to copy unless you have some special hardware (Wasn't there something called "Blitz copier" a few years ago?) or have a lot of knowledge about disk-formats.

> Cracking is unlegal, and pirates should pay for their damage.

If you manage to copy a copy-protected disk it's basically the same as cracking ;-)

The C64-community is still alive, thanks to those that collected old games and distributed them. You can buy CD's with all Atari 2600-games ever made, along with good emulators to play them on. Hell you can even go into any decent shop and buy CD's with Amiga-versions of the very same games that I want to give away for free! Do you think that "Electronic Arts" or "US Gold" care?

I guess that you and other moralists rather see that the ST-community dies (I'm speaking about games here, not "professional" or "serious" use) than that we stretch a few laws. It's really easy you see, just stay clear of the cracks, buy second-hand games if you can find them and let us others worry about the law.

Let me just point out that I'm *not* supporting piracy of software that's still sold or supported! I know that a few old ST-games are still sold by 16/32 Systems, I'm not going to put cracks of these on a CD and distribute them!

ChroMagic carries Road Riot I think (but I can't find their phone #)
and I think that Systems for Tomorrow does to. Try
www.systemsfortomorrow.com and see if it is listed.

Space Junk never made it further than the demo stage to my knowledge.

|And are you sure that it CAB/PPP-Connect hasn't been released?
|System Solutions had a big ad about it in the last issue of Atari
|Computing. Also I bet that there must be translated resource files
|for them as ther are both swedish and french resource files available.

Magnus,

The stated release date for the english version of CAB 2.5/PPPConnect has come and gone, and System Solutions has declined to set another release date, saying only that it will not be within the next 2-3 weeks.

It was my understanding that everything had been translated and that the literature was on its way to the print shop. That seems to not be the case now. I find this a bit troubling, but only because I am so eager to get ahold of this program.

I have about exhausted my patience with trying to get the STinG dialer to work with CompuServe (my only PPP-only ISP), but I've got it working fine with Delphi (which acts as a PPP/SLIP ISP). I have found no reason that CIS and STinG's dialer shouldn't get along, but still they don't communicate. I believe that it is something that CompuServe is doing that is the problem, but no one can imagine what it might be. :(

See ya,

Joe Mirando @ STReport

Or at least separate out the English bits so that those of us who are uni-lingual don't have to download several megabytes of German info as well.

Also, a version which can be unpacked with the current version of ST-Zip would be useful. And why have it encrypted, when the decryption key is apparently free to anyone who asks? This sounds suspiciously like a method for building up a mailing list...

But how many ST owners can use 256 colours, or Falcon owners for that matter.

I will try to mail you a screenshot as soon as I can get one. For now I can't of obvious reasons.

IMHO. It's sad that such a great idea would be spoiled by to much graphics
which doesn't realy make any sence to me.

Nostrodamus phrophesised this from curis@vedette.ens.fr to All...

Hi Emmanuel!

c> Organization: cole Normale Sup rieure, Paris

c> I search for a SpeedoGDOS font-editor, if possible freeware
c> or shareware. Does anybody know where I could find one ?
There isn't one I'm afraid. Bitstream won't divulge the format of their font
files so no-one has been able to program a font editor.

That's really sad... Is Bitstream still making & selling Speedo fonts?

About the only thing that you can do is to convert Speedo fonts into Calamus
CFN font files and edit those, but of course you cannot convert them back.

I'm really interested in that! Could you tell me where I could find a
programm that can convert Speedo font in Calamus fonts? I use Calamus very
often and there are some really nice Speedo fonts I would like to use with...

> So lets go for it! :)

Yes. There isn't realy much to lose. I would also propose tp try to
create
several new groups at onoe time, insteed on just one at the time. Or
can't
you do that? I think we realy need them if we wants things going on the
atari
side of the newsgroups.

Anyone who wants to make a try, someone who can write some convincing
stuff in
good english? I can help out if someone wants me to.

And don't come and say that it's not needed, becuase it is and one
reason is to
kill one or two mailinglists and get the discusion out in the public.

On Sun, 21 Sep 97 20:24:48 GMT, in comp.sys.atari.st you wrote:

>In my humble opinion, and after just one year of internet pratice, I
>have not seen a lot of atarists surfing on the net with Atari

I agree, using an ATARI is in the minority, and if people are using
an ATARI for internet access then its usualy a Falcon, TT, Mega or
something with lots of add ons... BUT I am not suggesting there are a
lot, and I am certainly not suggested an ATARI is better for internet
access... Only that there ARE people with ATARIs and the possibility
of any ATARI user not being able to access an ATARI page is silly ..

>computers ... and in France THIS IS A FACT ... only a few people are
>using Atari computers on the net, excepting a few rare 'birds' who own

But some are..and when you have an ATARI page you don't want to turn
ATARI users away because they are in the minority ?

>have bought all my atari computer stuff in second hand !) NOBODY seems
>to use the net graphic capabilities with a 1040 ST black and white

Yes they do.. I know a few people who I talk to on IRC channel
#atari who do...My artist Dean Chadwick is very happy with a STe and
Medium rez with CAB.. so are lots of ATARI users...NOT lots and lots
:), but there are some,
If my page..or your page was on any other subject, then it would not
matter, but as they are ATARI pages for ATARI users then you must
cater for the few people yes? :)

>PEOPLE ARE CRYING TO RECEIVE HELP TO MAKE A SIMPLE CONNECTION WITH
>THEIR ATARI ... JUST LOOK AT THE ARTICLE SUBJECTS RIGHT HERE !!!

!!!!! but that proves people want to connect with there ATARI, I know
it also proves its not easy and some of us will take an alternative
method :).. but your above comments only proves there are a lot of
ATARI owners using there ATARI to access the net ,
>
>We are speaking together via at least one IBM compatible ... I'm
>almost sure you are using one :-) Isn't it ?

Of course yes I am.. I had about a year using my STe for internet, I
started my web page using a STe one meg and floppy system, then I saw
the net in colour.. and WANTED some of that :)))) But I still
understand that others are on there ATARIs and I want them to access
my web page..

>And now we must surely speak about the future, the atari lovers future
>.. Are you so sure serious atarists will continue to fatigue with

Have a look in this newsgroup NOW.. there are a couple of threads
where people have bought half meg and one meg ATARIs and are asking if
they can get on line with them... so not only are some people staying
with there ATARI.. NEW people are coming on line with ATARI..

And the NEW people are the ones who will want your page and your
excellent service yes? :)

>searching you FIND and I think, it's the moment to find something
>interesting in Atari computers other than a 1040 STF to make an
>internet connection ...

Like I say...not everyone wants a TT or Falcon... what use would a TT
be to me?... I make software for ATARI computers... I can't make games
using a TT......and if I use a Falcon to make better games.. this
would mean a lot of ATARI users would not be able to play them... so
in my example a Falcon or TT ect is useless to me... only my trusty
STe will do :)

>I have always my good old 1040, but really when it comes to internet
>surfing ... forget it !

I agree, a standard STFM is not the best.. but it does not alter the
fact that people out there are using them, and you want them to come
to your page?
>
>Find a falcon at $250, put an accelerator board inside, put the whole
>thing in a tower, spend a little money and buy CAB 2.5 and above all

and that would be useless for me .... and other people have other
curcumstances... its not that simple...
>..
>FIND SOMEONE EXPERIMENTED IN ATARI NET CONNECTION AND INSTALL MINTNET

You think Mintnet is a step forward ?..... hmmm

>I must apologize to not have found the exact english worlds for my

You write perfectly and fully understandable :)

>So let me work at what I can really do ... nothing less than
>TRYING TO DO SOMETHING INTERESTING FOR OTHER PEOPLE.

I know... no one is questioning the content of the page, as I say, an
excellent and worthwhile idea and service, full marks... BUT it is for
ATARI users isnt it ?... and there are ATARIs out there surfing the
net.. yes even one meg owners with no hd... they are looking for
software... all the point was that the page should be easy to access,
speed it up, :)

3818. organizer wanted!!

Newsgroup: comp.sys.atari.st
Date: 1997-09-22 00:00:00 UTC
From: Ken Macdonald <macdonal@cfcsc.dnd.ca>
Message-ID: <342674E8.4C63@cfcsc.dnd.ca>
Source record: 116450

Maybe I've missed something, and that's why I am here to ask!
I am looking for a do it all organizer.
Right now I use Calappt (from Atari) because it does work
and it does _almost_ everything I need.
What I need is a program (or acc) that will
-have a calendar
-scheduler
-phone, address list
-phone dialer
-a "to do" list capability or notes
-calculator(?)
-import/export ASCII text/db files
Calappt does all except the "to do" list and calculator,
and I haven't found another program that comes close
To Do, Address, de Capo, etc don't unfortunately do as much.
thanks for any help!

3820. SCSI HD: Read & Write Errors

Newsgroup: comp.sys.atari.st
Date: 1997-09-22 00:00:00 UTC
From: kzarback@hotmail.com
Message-ID: <874937632.19496@dejanews.com>
Source record: 116452
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here is my config':

Atari STE 4Mo, SCSI Host Adaptator Advantage+, HD IBM 548 Mo, CD-ROM
Drive Sony 55-S, and sometimes DAT Tapes Drive or Optical Floppy Drive...

Here is my problem':

Some transfers (i.e. read and/or write) to my SCSI drives return wrongs
data (i.e. file is not recognised, or the program crash...) and that's
not depending on my software configuration. It's an only hardware
problem. =(I heard something about timing errors on some STe's ASCI
Port, and/or DMA's bugs... Is there any solution?

Thank you!

(--
Sorry about my so lame english grade... =P

Best offer to my mail by Wednesday, 09/24/97, midnight CST.
Current high offer is: $45.
***

I recently acquired this hardware, and to be honest, "my eyes were bigger than my stomach" (i.e. not enough room). In fact, I'm going to off-load some CBM stuff as well shortly. These Atari items were gathering dust, so a good cleaning in and out would be in order. I have no manuals, software, or original boxes, just the hardware. In any case, here is what I have for sale:

Atari 520ST w/PS
Able to get it to boot up into the GEM desktop (no mouse to use) and using the alt-arrows able to move around a bit. Seems to be working fine. Not sure what TOS version, as all it said was TOS.

Atari SF354 w/PS and connecting cable
No diskettes to test with, but whirs, clicks, etc. when booting the ST. Looks good...but buyer beware since I cannot test it adequately.

Atari SM124
Seems to work fine and looks good. Just a hint of a picture "wobble" at left corner. Didn't seem to be annoying...but thought it worth mentioning.

It does not matter to me whether these go as a bundle or parceled out individually. Buyer will be responsible for shipping, so keep in mind that your offer should be in the form of $$+shp. I'm willing to ship USPS or UPS your choice.

STOSSER Software
http://www.airtime.co.uk/users/stosser

Presents

H.E.R.O.2.

Human Extraction and Rescue Operation

Programming : Tony Greenwood
Artwork : Enhanced By Dean Chadwick
Original By Bob Goodfellow
Released as : Freeware

Minimum Setup : Atari Ste and 4meg memory,Joystick, Colour Monitor

Supporting : TOS 1.60, 1.62, 2.05, 2.06
4.01, 4.02, 4.04, 4.92
STe, MegaSTe, Falcons (NOT Emulator compat')
Hard or Floppy drives,

Features :
{}Excellent DMA Soundtrack, Sampled sound for every action,
{}Fully animated Menu system that's worth loading just to see:)
{}Extended Object Animation, ie: when actions performed on objects,
()Main Character has over 250 separate frames of animation,
()Free roaming Baddies,NOT set paths,Open a door they go through ect
()Eight way scrolling of SIXTY Large levels packed with puzzles,
()Full Game Save and load options,
()Fully Hard Drive Compatable from anywhere,

And much much more that has to be seen :)

NOTE ** H.E.R.O.2 is NOT intended to be a whole new version of the
original game, the project was to make H.E.R.O. work on TOS 206 and
Megas and falcons, But as these usually have extended memory we
decided to add lots of luverly goodies, Some maps where deemed far to

difficult so some have been edited to make the learning curve a little easier (ya whimps!)

NOTE ** Tested on Falcons with TOS 402 and 404, Run from a very clean system NO accelerators and from ATARI Low rez, remember CLEAN SYSTEM!!

The game is FREE, and arrives on three 720k disks, you can download these as three zip files averaging just over half a meg each, or you can send off for the game, If you decide to post for the game we do not want to be out of pocket, we ask nothing for the game, but we don't want to pay to send it to you!, A decent jiffy bag, three blank disks and return postage, we get nothing from that, only the pleasure of knowing you actually want the game :)

CONTACT

All postal contacts must write to the artist Dean Chadwick at:

138 Townsfields rd
Westhoughton
Bolton, Lancashire, England
BL5 2NT

email
dchadwick@zetenet.co.uk : Dean for all post and downloads,
stosser@airtime.co.uk : Game support, NOT Level Solutions:)
atari@iname.com : As above

Web address

Main STOSSER Software page at:(Sign the Guestbook as well!)
Here you will find details of all (50+) STOSSER titles,
http://www.airtime.co.uk/users/stosser

Most IMPORTANT, We need your feedback, this is our incentive to make more programs and games for your ATARI....so write now!.

NOTE ** We made out last three games Commentware, begging for feedback, HEARTLAND, DIAMOND ICE and BILLY BOY, All well received and very well reviewed with top scores everywhere, Total feedback for all 3 releases together equals, just less than 50 People :(

NEXT Project, we will definitely have a one level playable demo of our next project ready for the UK ATARI shows in october, but its a secret what it is just for the moment :) see web page for more details,

Cheers !ynoT (ATARI Programmer)

Yo! Peter Dude!

Whilst under caution Peter said to Officer Steve :~)

SS>> Personaly i'd change all the Low voltage Electrolytics caps and
SS>> expect a result.

PW> OK, I'll try that when I get the time.

Time?, i thought you were retired. 8~)) If you like i could do it for you,
ive probably got the caps in my car, failing that, make a list quickly and
you can have a rumage in the car boot at CHES on wednesday.

PW> Derryck has said he'll loan me aspare PSU at the club on Wednesday, and
PW> I'll have a go afterwards.

If your machine has the space ive a PC PSU you can have.

PW> In the meantime I re-soldered all the connections on the pcb, but no
PW> luck. Am I right in thinking that the psu won't work unless it has a
PW> load on it?

Being a self oscillating design it may well squeg, so yes a load is
neccesary, plug in an old HD or something sacrificable.

PW> I can supply one with bulbs, I guess.

They always manage to dazzle me.

PW> BTW, you don't happen to have a circuit of the Phihong version by any
PW> chance?

I draw circuits in my head as i work, so i'm no help i'm afraid.

I have a similar setup, except that I have CAB 2.0. It works quite well,
but CAB.OVL bombs out from time to time. This *could* have something to do
with the fact that I'm running it on a Falcon with Afterburner installed,
but I doubt it.

Rather than TOS 1.4 have you thought about getting MagiC? Even a
second-hand copy of v2 will be OK. It completely replaces TOS, gives
fast disc operation AND multitasking etc.

In the meantime run FATSPEED in your AUTO plus, perhaps, CACHEnnn.
These will improve HD performance.

Well there has to be something for memory.Or else PKZIP would just keep eating
up memory until it crashed.I've run PKZIP on 1MB PCs before with no errors.
PKZIP was writen long beofre there were 16MB PCs.

>Port, and/or DMA's bugs... Is there any solution?

I suppose you MAY have one of the bad DMA chips but problems like this
can also be caused by:

1. Wrong SCSI termination.
2. Bad quality/very long SCSI cables.

Check these first.

This seems to mean your server has a problem with it's feeds, it
gets only messages in c.s.a.st and shows you in c.s.a.st.tech only
crossposts... Because there are only some (not many) crossposts there.

>Why would I want to read the same messages twice?

Any good newsreader doesn't show you twice crossposts, or at least
it shows them as read. BTW you use TIN, it seems to have broken the
references of this thread, there is no reference to my message or even
to Magnus Kollberg's one?

>we will have to also start rapping nuckles on those who blindly
>crosspost messages that really belong in _one_ of the newsgroups.

Yes, that's simple Netiquette. In any case one should not post
blindly.

>And, in order for all of the above to work, we need to be able to
>define the difference between the two groups in one simple sentence,
>otherwise people will get too confused and post to the wrong group.

comp.sys.atari.st Discussion about 16 bit Atari micros.
comp.sys.atari.st.tech Technical discussions of Atari ST hard/software.

...is not enough? Or there must be a charter for these groups, but I
don't know where...

Bye! Bruno.

I had to perform additional jumpering to get one of these Sonys to work as a drive B, IIRC I had to connect the DS1,2 and 3 lines to earth (easy to do on the connector as one row is earthed). I don't have the details to hand but a web search should soon bring out the Shugart interface details.

Speak to 'ya later!

>version 1.81, perhaps the problem is in the overlay.

Hi,

IMHO the problem is on the account of the cab.ovl 1.26 (or maybe
gluestik).
For now I don't have an alternative because I can't make the
CAB-for-MiNTNet overlay v1.81 working with my setup. The old overlay,
v1.77 I believe, however did work.
As soon as I try to download online a page I get a warning
pid 56 (Cab) Bus error..... and Cab crashes.
MiNT is set to "no memory protection" and the memory flag of CAB 2.50 is
set to "global".
I tried the CAB-for-MiNTNet overlay v1.81 with gluestik 0.02b4
activated.

Some drives expect the computer to have its own SCSI ID. In order to
give a TT or Falcon a SCSI ID you need a hard disk driver that supports
this feature which is called "Initiator Identification". Without a
driver supporting this feature the Fireball is not recognized at all.

HP deskjet 500 printer

it depends on the programms you use. Mostly you find LaserJet drivers in
older
progs that can be used. Modern soft should print with NVDI routines or
come
with DJ500 drivers 'cause it is the (ink) printer standard of the '90ies.
Frank
ps: forgot to say there are problems on older DJs if printer is not ON
while booting. But there are some software solutions to that problem, too

I think you must make an RFD/CFV per group, but I don't know if you
can post many proposals at the same time (don't think so). Anyway the
reply must be in the help document posted in news.announce.newusers with
the title "How to Create a New Usenet Newsgroup".

Bye, Bruno.

Just replace the drive mechanism with a PC 1.44M drive. Be sure the PC
drive has jumpers or some way to change the drive ID. Sony and Teac
drives are often recommended. I have just managed to convert a Mitsumi
drive with no jumpers.

Other thing, the connecter inside the the drive unit must be twisted
upside down to connect to the PC drive.

Yes I notcied and it did help a bit. The links are still hard to read.
Blue and purpule doesn't realy get along as well as read and blue, pink
and red etc. etc.

> The best browser to acces to every graphic U.T.S.I subtility is
> without contest CAB 2.5 ... atarists, be aware of that fact !!!

But this is utterly crap! You should never design a page to look the
best
with a specific browser. It doesn't matter if you use Netscpae CAB
whatever.
The pages must look good in _any_ browser.

I bet that most people who access your pages are not using and atari
machine,
but does it at work fomr a Unix box or PC.

> If somebody has found some benefit from this new U.T.S.I
> modification, just drop me an electronic letter.

It's better, but there is still some to do. :-)

Is it only me who have problems with purple text on dark blue
background?
I wonder why not all magazines looks like that...

Hi!

In article <603fl8$915@alexander.ins.cwru.edu>,
bdc2@po.CWRU.Edu (Boris D. Cahan) writes:
>>I use RAMDISK.XFS for MagiC which is a dynamic ramdisk
>>running as well on TT-Ram.
> And where does one find it???
Take a look at ftp://ftp.uni-kl.de/pub/atari/mtask/rdxfs_r2.lzh

The docs are German only, though. I'd still like to find someone to
translate them, but up to now I've had no luck, and also no time to
do it myself (not to mention the language problems ;)

And don't forget: this Ramdisk-XFS is for MagiC only, it won't run with
MiNT or Single-TOS. It's fully dynamic, supports long, case-sensetive
filenames, and comes with the complete sourcecode, including a Pure-C-
interface to program your own MagiC filesystems without being forced to
use assembler. And it allows you to specify which type of memory it should
use: ST-RAM only, TT-RAM only, ST-RAM preferred, or TT-RAM preferred.

Ciao

Thomas

So what do you use your Atari for? Games? Oh you maybe have a copy of
Apex or
Papillion and do graphics? Or maybe stewart to get some fancy effects on
the desktop
but is totaly useless if you want to do something. Actaully it strikes
me sometimes
and I wonder what people do with their ataris. If they are palybg 10
year old games
I would almost say that it is a dead platform as noone uses new
software, atleast
if you talk about comercial software.

> >Huu...?? So where can I buy "Magic Pockets"? Popolus?
>
> At 16/32 f.ex!!!!

They have? I must take a look then. Do they have a home page as I don't
have my copy
of Atari Computing here at work? Also, does Popoulus work on the Falcon?
If it does
I guess I have to buy a copy. Is it HD installable?

> can also be caused by:
>
> 1. Wrong SCSI termination.

The termination, based on resistor, is on the last drive on the SCSI
chain: the CD-ROM drive (all my peripheralls are internals).

> 2. Bad quality/very long SCSI cables.

Mine is less than 20". Ok, it's home mad... I have just added the missing
connectors (HE1000 2*50) =P

So, what about DMA chip?
If it is easy to replace, where can I found any?

Thank's for all!
Florent

Hi,

I just looked at www.amex.com and noticed that JTS is
the most active stock right now. When I clicked on the
link to JTS I got some funny things. If this is correct
it looks like the Tramiels have taken over JTS and sells
proprietary personal computers and video games. :-)

I guess all this must be a wrong and that it some old
remains from Atari that shows up, or has the Tramiels
taken over JTS now?

:-)

In fact this is really not true ... look at some very good games which
are ST, STE, TT compatible and which are using hard disk installation
.. In fact it's a pity to see that so much games won't run on a TT
because lack of programming ... Be aware I'm not at all a programmer,
but a user ! I like very much games or other programs which are
working on a TT ... there are no reason your games don't work in a TT
.. why ?

I have just plucked up courage and attempted to install MINT using KEMD etc

I have a 1040STFM with 4meg RAM TOS v1.4 Hard Disk etc

Once installed every time I attempt to run MINT I get the following message

"Couldn't sync or lock device j:." The system then checks everything in sight!

Is this usual or do I need to correct something in my setup?

Generally, drivers come with the applications which require them. The
applications will have their own drivers - as the HP is very common
your friend should have no trouble.

If the application uses GDOS and relies on the drivers and fonts
supplied with it he can either use GDOS v1.1 which will be included
with the applications which require it OR he can get NVDI which
substitutes for GDOS and will also give him better display speed.

Look for something called Pinhead. That will really improve performance. There is another autofolder app, but the name escapes me now. These together will bring your drive alive. Search around some utility/disk ftp areas for some older hard drive software. There are a few fixes available to make T/1.02 acceptable.

SUBJ: EZFlyer problems

In a message of <19.09.97>, ai063@FreeNet.Carleton.CA (90:102/0.99) writes:
a> I'm still having termination problems--I think.
a>
a> I'm now trying to get two EZFlyers (230 Mb cartridges) to work in
a> tandem. My setup is Atari 1040STe--LINK 2--passive
a> terminator--EZFlyer 1--EZFlyer 2.

That doesn't look right! According to received wisdom termination should only be present at either end of the chain, /not/ anywhere in the middle. Now Link 2 has termination at the sending end, so the passive terminator belongs after EZFlyer 2, if anywhere. I don't know about self-termination of these drives - if they do, make sure that the first one does not terminate itself! Does the manual state how the drive knows when it should terminate itself? Perhaps by nothing being plugged into the second socket?

a> When using the first EZF by itself, I had to put the terminator
a> between the LINK and the single EZF, in order to get it to run
a> properly.

That's very strange. I have the EZ135, which works well with the Link 2 on one SCSI plug and the terminator on the other. The EZFlyer may be different, of course - in fact it must be if it has self-termination.

a> When I added the second EZF--port B in EZF-1 to port A
a> on EZF-2, I started to get the same sort of copying errors when
a> trying to copy files from EZF-1 to EZF-2, as I did when using EZF-1
a> by itself without the terminator.
a> It seems I may need to terminate EZF-2, too, even though the EZF
a> manual states an EZF at the end of a chain terminates itself.

Perhaps you are using too long a lead, or an unscreened lead? Those can sometimes give rise to copying errors, due to interference. One more thing. Try switching off the write caching and see if matters improve -there could be timing problems if writing is delayed.

If all else fails, it may be worth trying another HD driver. Which one are you using? Mine is the ICD one that came with Link 2.

Regards
Peter

>Blue and purpule doesn't realy get along as well as read and blue, pink
>and red etc. etc.

Some people have difficulties to read nearest colors like red and
blue, but that's not the web conceptor's fault ... in fact a lot of
people have difficulties to read or to understand, or to distinguish
some kinds of colors like red and green, yellow and red, red and blue
and so on ... I think it's called 'daltonism' or something like that
..
Also some people don't like some colors associations but we cannot do
something which shall be loved by everyone, it's a questionof taste
and perhaps an art question, while speaking about color associations
I think it becomes an art and taste question nomore a technical
question ... when some people are able to read or to distinguish when
some aren't able to do, it can't be a technical question anymore.

>> The best browser to acces to every graphic U.T.S.I subtility is

For Sale:

-Mackie 1604 (orig) mixer, perfect condition, home studio use only, original box and manuals, etc. You know what this is.. I'll take $500 or best offer. I'm replacing it with a new more expensive mixer...

-LineAudio Jam-8 OUT output expander for the Atari Falcon. Features 8 balanced line level, high quality outputs compatible with any Atari or C-lab Falcon and Cubase Audio, Logic Audio, Zero-x, Audio Tracker, etc. I'm selling it because I need to buy an ADAT interface instead for my Falcon. It's in perfect condition and has never left the sanctity of my home studio! I paid $450 for it, would like to get $350 for it, but I will take the best offer (or trade for the Falcon ADAT interface). If you don't think it's worth that, please make me an offer of what you think it's worth.. I'll definitely consider it!

-Chandler Tube Driver rack mount tube preamp, perfect condition, sounds great. I bought a new amp and no longer use it. $130 or best offer...

-Mark

I looked at the listing, and I would guess that it is a mistake using
old Atari information. One of the tip offs was it listed Augie as
being with the company, and he left Atari to go work for Marvel (or
was it DC, I don't remember) Comics in the fall of 95.

I have some questions I hope some of you Atari-dudes can help me with.

Due to cutbacks in finances I have had to trim here and there in my
computing department but hope I can get by on an Atari.

Here are the questions.

1) Toad computers is supposed to carry Atari computers but doesnt. Where
can I buy Atari computers? In particular I am looking for a computer that
can do the following:

Connecting to my ISP HOPEFULLY at 28.8K - using a terminal program
that can handle 28.8k I can use the utilities from my ISP (LYNX,
TIN, PINE, IRC) to do all my interneting needs. It would also
be nice to download stuff off my ISP.

Word Processing with Spell Checking and hopefully allows for
a wide range of print drivers for different printers.

Math software to allow me to do calculus-deep calculations which
also stem from Trigonometry, Linear Algenbra, and Calculus

2) Where can I get a copy of Loom? I am looking for a Mint copy

thanks

Hello Andy,
You can use the Atari to access the internet but you probably need at least 1meg and possibly more. I use CAB for WWW access and have just started using Newsie for newsgroups and mail. One point to consider is that your provider needs to offer SLIP access rather than PPP.

Yours,
David James

Well, I did say I could be wrong :-) I'm going on what's happened with
all the variants of GDOS I've tried. I haven't played around with the
NVDI drivers (on the principle of not fixing it if it isn't broken)
except to correct the print area margins which were leaving a
ridiculously large area at the foot of the page which you couldn't
print in.

>>So if you use a Papyrus driver (the supplied BJ10 one is

>regardless of which version I use...).

After some fiddling I managed to get the supplied one to work with
Papyrus 4, but have reverted to NVDI since upgrading to version 5

(largely as it came set up that way). Can't remember precisely what I changed, though I think as supplied it was basically an Epson LQ driver with a couple of codes changed and it obviously hadn't been tested. I think I still have it somewhere. Mail me if you want me to send you a copy, and I'll see if I can hunt it out.

>Why should I stick to NVDI instead of Papyrus' own drivers? I mean, apart
>from the fact that the Papyrus programmers obviously just put a few random
>codes in it and certainly never actually had a BJ-10 connected to their
>machines to test it in real life.

Too true. I tried all sorts of DIP switch combinations before digging out the BJ10 manual and fiddling with the settings. As supplied it either produced total rubbish or garbage characters at the start of each page, IIRC. The finished version worked with the same printer settings as the GDOS/NVDI drivers and all the other BJ10 drivers on the Atari (ie DIP switches 7 and 10 on, as discussed previously).

<snip>

>I tried both NVDI drivers which I think I had edited, and there was

That sounds about right.

>I'll look into those drivers again, but it doesn't really make much sense
>to me, even when looking through the manual and comparing things.

Well, if I'm right with the above suppositions, I guess the only time 180 is useful is if you're short of memory as the page image that has to be generated and sent to the printer should be about a quarter of the size (if my maths is correct).

>How come I can't get to print in "economy mode" via NVDI. I'm sure this

>normal use.
>Does it have anything with the fact that NVDI prints the characters in
>graphic mode while just printing out from say "7up" or "ST-guide" uses the
>built in fonts/character set of the printer itself?

Yes: I'm pretty sure economy mode is a text-only function and can't be applied to graphics output. All RIPped output from GDOS/NVDI, Calamus etc is printed in graphics mode.

>>>I can see a big difference when printing text bypassing NVDI, by pressing
>>>the "economy/HQ" button on the printer priot to printing.
>>

>it to the printer icon!

Shucks, you mean like you're supposed to be able to do? That's be
too easy! I've never used Idealist, so someone else needs to come in
on this one.

>>If it's any consolation, we in the UK have similar problems trying to

>the screen, then all of a sudden a character is replaced by a totally
>different one, and the first one is in an entirely different place.
>What kind of standard is this?? Is it just Canon's own way of setting up
>their character sets ;-) ????

To be fair I think it's less a Canon problem and more that ASCII is
only standardised up to code 128. Hence there are about a million
variations on extended character sets. Some include block graphics,
some italic characters, and there is next to no agreement on accented
characters. It's largely because ASCII started as a standard for
English-language encoding and therefore accented characters weren't

catered for. The ensuing mess which occurred once accented characters
were incorporated is the main reason why HTML has to use those coded
entities to ensure all platforms know which character is meant.

>Oh, another thing... I don't understand the sheetfeeder part of my printer.
>I thought it was supposed to automatically pull the sheets into the printer
>as they're needed, but I've never gotten this to work for me. I always have

>What have I done wrong?
>(I bought the printer second hand and I didn't get any documentation for
>the sheetfeeder. And as far as I can tell the printer manual doesn't say
>anything about it except mentioning it's availability).

Can't help you with this one as I never bought the sheet feeder: I
don't print that much stuff out so feeding single sheets has never
been enough of a chore to make it worth the expense. And it looked
like the kind of thing that might go wrong a lot!

Cheers,
John

>I get an error message when loading the dialler saying: "Don't use
>this dialler with multistik".... (??)

Make sure the AUTO program is after HSModem in the AUTO folder (I had this message until I did that).

I've now given STiK 1.13 a try, but had to go back to 1.12 on account of the fact that the "Connect" button in POPWatch seems to do absolutely nothing with v1.13. (This seems to be a problem with the new dialer, rather than the new version of STiK, because v1.12 also has this problem when I use the new dialer to connect. Any idea why, Gary? NewsWatch seems to work OK.)

Anyway, apart from this, and the main code now being in the TSR rather than the accessory, I couldn't detect any difference between the two versions.

Later: The POPWatch problem is worse than I thought: the new dialer seems to "taint" the original STiK accessory somehow, so that after the dialer has been used, POPWatch won't work even if a connection is made with the original accessory, unless that accessory is terminated and re-started first. What on earth is going on here?

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

Here we go again, sorry it's rather late.

The new addition of ICTARI, the Atari programmer's disk-zine
is available at:

http://www.elis.demon.co.uk/ictari/ictari49.zip

(Demon's WEB-server seems to be taking a while to catch up,
the main site is http://www.elis.demon.co.uk/ictari/ictari.htm)

Anyone who's been threatening me with articles might consider
carrying those threats out if there;s going to be an ICTARI 50.

Have Fun,
"Augeas"

yes, it should be very possible (I use a DeskJet 540 myself). It
all depends on what programs he'll be using to print with. If he's
doing desktop publishing, Calamus includes the necessary drivers, so
should the latest version of Pagestream. If he's using GDOS programs,
the latest version of NVDI includes several DeskJet drivers. If he
wants to print out graphics files, both Imagecopy4 and GEMview offer
Deskjet support.

As far as I've ever seen, this is pretty much normal. Remember, UNIX-based machines were never really meant to be powered down by just hitting the power switch. There should be a re-boot, or shutdown command. This will flush all the necessary caches.

Jo,

The one thing I've noticed on the actual page where you list the
different categories of software is that while the colours of the
table cell backgrounds are specified, the colour of the text is not.
I have CAB set up to default to Red for highlighting links, so the
Music Software link shows up as Red on Red, or no visible text. Maybe
specify black or white text so this doesn't happen.

Regards,

Before I place this ad on the NET I wanted to ask any Atari users if they would like this system. It was put togeather by TOAD Computers and is in real nice shape. Just boot it up and off you go. I know its not an Atari computer but just wanted to ask here first. Here's a quick list of what it's got: (more info to follow)

TOAD Chameleon System

Pentium 133-socket 7 with heatsink and fan
32 Mg. Ram
256K cache
1.2 GB Hard Drive
Matrox Mystique Video Card with 4 Mg. Ram
SoundBlaster AWE 32 upgraded to AWE 64 via Creative Software
ZOOM K56FLEX Fax modem-internal
8X Speed Creative CD drive
Eagle 96 Exabyte Tape Backup System with excellerator board and 4 backup tapes 1.6 GB uncompressed 3.2 GB compressed per tape
1.44 Floppy drive
Spacewalker HOT-541 motherboard-includes VRM Module so you can put an MMX CPU in it.(more specs. to come on motherboard)
Joystick
Speakers
Beetle Mouse
Windows 95-installed * Encarta 96* MicroSoft Works* Microsoft Money.
(If I left anything out I'lllet you know)
Tower case
Nice all around system---ASKING US$1100 + Shipping. US & Canada ONLY!!

> ...and don't forget to short the "disk detect" switch!!!!

You're right, but I haven't figured out which are the correct pads to
connect in the Mitsumi drive. The Mitsumi has no jumpers inside, but 12
tiny solder pads that seem to work as such. Shorting them with a
screwdriver, I managed to figure out that the one marked A/D was somehow
the the ID selector...

> If you don't do this the drive won't notice when you change disks and next

Mechanically, it fits fine, maybe a little short more than too long.

> How about the disk "eject" button? Does the modification I've explained in
> the file (location below) I made work for this drive as well?
> Once again... in case someone wants to upgrade to 1.44Mb (or replace a

I cut out a rectangle in the ST case. I know it's not as pretty as
before, but I prefer it that way.

> ftp://ftp.sn.no/user/hallvart/atari/info/sony_144.zip (16 Kbytes)
>
>

While we're on about this, someone told me that an STE with an Ajax
chip, TOS 2.06, jumper pad E6 and a drive with Pin 2 (HD Detect) enabled
would automatically detect and switch to HD mode without the need of the
extra circuit.

I guess this is wrong because, as it doesn't work for me, and I've read several text files that don't mention it.

Also, I have put a link in my FAQ to a zipfile that contains all the textfiles I have found on the subject. Several of them have an interface like the one you seem to be designing.

Let us know anyway...

From: Uwe Seimet <us@ooc.de>
Message-ID: <3428BD53.2DE4@ooc.de>
Source record: 116299

Paul Luscher wrote:

> What is the limit for Hard Drive Size and Partition size addressable
> with AHDI on an Atari Falcon? Is it different for IDE and SCSI?

The Falcon hardware doesn't impose any limit at all. Concerning AHDI and IDE drives I don't know but SCSI drives only work if they have not more than 1 GByte capacity. AHDI is not capable of adressing sectors that lie beyond the 1 GByte limit.
Other drivers, e.g. HDDRIVER, support IDE/EIDE and SCSI/SCSI-2 drives of any size.
The maximum partition size depends on the TOS version. With old TOS versions 256 MByte ar possible TOS 2.x and 3.x support 512 MByte per partition, TOS 4.x supports partitions up to 1 GByte. When MagiC 5 or Big-DOS are installed you can have partitions up to 1 GByte independent from the TOS version. In this case you can also use DOS compatible partitions which have up to 2 GByte per partition. Note that with MagiC and Big-DOS you can also have more than 14 partitions. MagiC supports up to 23 partitions, Big-DOS up to 29 partitions.

Hi,

Does anyone have a copy of Atari World #3 they would like to sell or trade for some issue of ST Computer (German) magazine, STarT or any other U.S. mag I might have (I don't remember all of them:)?

Pls reply email by removing the spam block in the email address.

Thanks,
Mike

A friend of mine, who's wife is a teacher, purchased EZ Grade some
years ago. I wouldn't be surprised if the author still sells it.

There's also a program called CLASS, although I don't know if it's as
good as EZ Grade. Still being a GEnie member, I can download the EZ
Grade demo and CLASS if anybody is interested.

```
********************************
Name: CLASS_45.ARC
Date: 931011
Approximate # of bytes: 105984

Description:
This is version 4.5 of CLASS, a combination electronic gradebook,
statistics, and graphics package for teachers at all levels. CLASS
stores names and grades, calculates averages, shows grade distributions,
and much more. It's fast, flexible, and very useful. This version
allows viewing text files from within the program, exporting and
importing student names from other files, converting scores to
percentages, and several other new or improved operations.
See CLASSDOC.ARC for a more detailed description of old and new
features. Runs in color and mono, on TT and ST machines.

It is? ;-)

Seriously, IMHO I think to manye people use way to much gfx on
their webpages. It's much nicer if you use it sparse and only
where needed.

TOS ERROR 35 means your ATARI cannot find everything it needs to run
your software, either you have a important file missing or the
software is corrupt
Nothing to do with memory
Nothing to do with your ATARI or ATARI operating system,

It is a probvlem with the software you are running, it is Incomplete
OR corrupted (Damaged)

HTH:)

Cheers !ynoT (ATARI Programmer)

I have downloaded the full version, but each time when trying to run
it I receive the same dialog (on a 1040 ST):
"Not enough memory for this application"

Nevertheless I have put your link on the U.T.S.I

>Copied directly from my original game...

Any money says it doesn't work 100%
FTL had stunning protection on their games and Dungeon Master was no
exception.

Think about it logically - if it was SO easy to copy games with just a
modified version of Procopy then there would have been no need for a
piracy scene at all. No-one would have had to crack the games because
this oh-so wonderful Procopy would have copied anything you could
dream of. Infact if your version of Procopy is so good it can copy any
game you care to throw at it - it makes you wonder just why software
houses even bothered to release anything, when they knew full well
that any ST owner could rip off their work with a tiny little utility.

I don't think you fully appreciate the quality of protection that some
games had (and indeed the skill it took to remove it)

Even the fabled Blitz "hardware" copier ballsed up on a lot of games.
Making copies of your own originals is NOT as easy as you make it out
to be and no amount of arguing will prove it otherwise to anyone who
knows half an ounce about how the ST works.

>>Oh please. The ST is dead. Some people just don't realise it.
>
>No, the ST is not dead. AS long as there is ST users left in this world, it is
>not dead. And there are other Ataris to my friend.

True. The ST itself is far from dead, the Atari community as a whole
is still quite vibrant in a muddy, slow trickling sort of way. But the
commercial ST scene is very dead. I don't care if a handful of PD
libraries sell second-hand games, no major retail store or
distribution outlet (such as Intermediates in the UK) stocks FRESH
released, original Atari ST software. Please - prove me wrong! Sure
they might carry the odd bit of Jaguar or Lynx stuff and possibly even
some of the newer STE/Falcon titles, but Damien's point was that the
STFM games market is DEAD on a commercial level (and hell, even on a

shareware one too.. okay so Tony might release a few games now and again (and pretty funky they are too) but we're not talking bitmap brothers quality here (sorry!))

You may find 2nd hand titles in old computer shops or car boot sales/markets/PDL's. But that's about it. The ST is also dead on a commercial level in most countries. If it wasn't then we'd still be able to go out and buy ST Format or any of the other great Atari magazines that have been around. The lack of support for the Atari in the popular press/media is yet another good indication of just how low a commercial level we are talking about here. Okay okay.. don't start spouting "Atari Times" at me please - sure it's a nice little publication, but it's a far cry from the ST's salad days.

>Ah, one of the little boys using an emulator with games cracked and mutated by
>the Pompay Pirates..
>Oboy, you are so coooool..

hehehe.. if only you knew...

only one thing killed the ST - time.

It lived a long and fruitful life, and as you've shown it lives on on a very practical day-to-day basis for a few other people too (lets face it though, this newsgroup is hardly an unbiased sampling is it) lot's of people are reliving those days that they long left behind by using the various ST emulators that are out there on their PC's. I know of people who've actually gone and bought real 2nd hand ST's purely because of the revived interest Pacifist has stirred within them. It's a big and growing area, emulation of the ST will soon over-take real use of it in terms of quantity of end-users. And I've started to see the benefits of this via new releases for the ST, old programs that were never completed or launched way-back-when are finally being finished. Things move on and no amount of words will stop them. But to blame the emulators for killing whats left of the Atari is naieve to say the least, sure people are downloading cracked games on a daily basis, but this is 1997 - not 1987 - there is no market for it to kill anymore. Share and enjoy.

Hi,

So here are my words of wisdom.

Whatever people may say about MiNTnet it's really the only way
to have a proper Internet conncetion. It's very stable and contains
drivers for every Internet protocol available right now (PPP, SLIP,
etc)

With MiNTnet and with the help of Gluestik one can use almost
every Internet prog available for the Atari platform.
Cab, Newsie, AIRC, Antmail, Telnet, aFTP, even the good old Oasis 1.35
(with the help of the excellent POPwatch and NEWSwatch) can be used.

OTOH: I must say that for a common Atari users with no
knowledge of computer science at all (like me) it's a hasle to setup
the MiNTnetstuff, especially if you're trying to build the setup from
scratch.
Thank to guys like Katherine Ellis (KEMD2), the people of the
TAF-package (Toronta Atari Association), Abel Philippe (PPP-KIT) and
the maker of the original KGMD package things has become much easier
to install. Nowadays everyone with a minimum of brains must be capable
to install MiNTnet using one of these easy-to-install kits. However to
be honest I never managed to get KEMD2 (sorry Kellis) and PPP-kit
working. I probably don't have enough brains:-)

>... Martin don't stop trying a lot of 'new' solutions which don't work
>at all ... at least at the firsts attempts ... a pity

Thanks Jo, I know you're grateful to me for my help with your
Internet setup and I'm not gonna stop my experiments. But please keep
in mind that all these experiments aren't my invention at all. They
coming from other people. I just try out what they have told me.

Sometimes, due to the language barriere, I misinterpret their letters.
That's why some experiments won't work from the first time. I'm sure
you'll admit that they do work after a certain time.

Therefore you should better send your expression of gratitude
to guys like Istvan Leelossy, Michel Vanhamme, Andre van Ryckegem,
Josua Dietze, Bruno Kozlowky, Jo Even Skarstein, Tom Thomason, Gary
Priest and a few other of which I can't recall their name right now.
They all have help me, directly or indirectly, to build up my Internet
setup like it is a present. Without them I probably shouldn't have been
able to surf the Net. Thanks guys

I want to figure out what the easiest to use MIDI scoring program for the Falcon is. Preferably something that you can hear the notes as you drag them accross the screen, like the old Activision Music Studio. I can compose cool stuff, but it is a lot faster if I can hear the notes as I place them. -Satcom2

>able to surf the Net. Thanks guys

Sure, all the people above have big, fat and very well featured brains

.. sometimes I must admit it's not at all my case ...

Although, Martin, you are among the most intelligent atari net users ...
also not my case ... you are disciplined like a programmer, gentle as a
friend and colorfull as an artist ...
Sometimes I must also admit that programs are not at all functionnal
only because they are 'NOT VERY EDUCATIONAL MADE' ... I must apologize
again here because it's surely a default coming from me ... I'm a
teacher ... but a lot of programs are 'NOT AT ALL PEDAGOGIC', so they
wait for the user to understand too complicated technical related
stuff ... IMHO programs should be made for 'ANY INTERESTED USER' not
only for techies or people who have 29 hours a day to experiment if it
will work or not ... So, enough said ... after all I have never
programmed anything except html pages (and here some people will not
find it tasty ...:-))

The best interfaced programs I use are without any doubt:
-Oasis 1.35E (with desesperately a lot of restrictions like the support
offered by the authors ... oh sorry ... the phantoms !:)
-CAB
-POPwatch
-Xurl
-NEWSie
-Aftp (I really love it !)
-HP-Penguin

So thank you to all the programmers who have made this marvels ...

I don't want to speak about MintNet, minix partitions, GlueSTiK and all
the rest because they were installed by my very best friend Martin ...
I'm not able to install them ... Really not made for me and a lot of users ...
otherwise we should have been a lot more in this nice place ...

Nevertheless, they work perfectly, so, THANK YOU to any atari net worker
and programmer ! The fun comes from you even if not so PEDAGOGIC ...

It's the computer myth !!!

There are several options, Dave, from shareware offerings such as PaCifiST (which I haven't had much success with) through to full commercial offerings such as MagiC_PC (very good, very compatible with *well written* GEM software) and GEMulator'96 which purports to be more compatible with non-GEM software.

There's a demo of the latter available from the Emulators Online home page (http://www.emulators.com) which I've tried, but I've opted for MagiC_PC from System Solutions which comes with Ease 5 desktop and can have NVDI_PC added on for Truetype font compatibility.

I'm an ST Newbie (and loving it -- 1Meg 1040STf) -- but I have a few questions that I don't believe are in the FAQ. (I found a quickie FAQ, but don't know where more/bigger/better are...) Anyway, here goes:

1) Does an IBM PC Standard parallel printer cable work with the ST?

2) My ST came with none of the original disks... is it legal for me to own copies of the original disks? -- As in: Does the software license actually belong to the hardware, or if the disks are long gone, am I SOL?

2a) If I can legally get copies, does anyone out there with big bandwidth that could e-mail me .dsk or .st files of them? I have T-1 access to the desktop, so big files are no problem for me.

3) Is there any documentation on the Internet on hacking in more memory? I'm no stranger to the soldering iron and could do it myself except I have no schematics to double-check against for any changes I may make...

3a) Anyone have a TechRef or schematic set for sale/trade?
3b) Other things I'm interested in purchaseing/trading for are a monitor cable, a SCSI board, the Crystal Castles game (if available for the ST) or anything else that sounds "neato."

Anyway, many thanks to any and all!

h> Could anyone please explain to me how I can download text files at
h> 3000 cps + but other kinds of files only seem to manage half of
h> this speed. I have a 14,400 modem.

Are these text files plain or are they archived (ARC, ZIP, LZH etc)? If the former, then your modem probably has compression incorporated (like my Sportster 14,400) and this speeds up the cps rate. Files that are already compressed, and binaries, often cannot be compressed much further by the modem, which is why the speed drops - but after unarchiving you get around the same throughput :-)

I normally get 1550 - 1600 cps, but virtually all my up- and down-loads are archived (mostly ZIP, some LZH - don't use ARC if you can help it, it's much slower and packs less efficiently). On Cix you /have/ to use ARC, but it's done automatically for you at both ends. On my point set-up archiving and unpacking is taken care of by Jetmail/Semper, again automatically.

It won't work with graphics printing via GDOS, I believe, as the filter only translates the character code sent to the printer, in the same way as for First Word Plus drivers.

h> "Idealist" which lets you do all sorts of fancy stuff when printing
h> has the possibility to add filters/remapping (I checked a few of
h> the drivers there, and tried to figure out how by checking the
h> "readme" file). Unfortunately the BJ-10 driver doesn't have it, at
h> least not for these characters. I can't quite figure out how it's
h> set up either. Can anyone help me with this?

Yes, I think I can - as long as you have the Canon BJ-10ex's printer manual and the printer in fact has a Norwegian character set in its software. While the IdeaList Canon BJ10e driver does not offer many character translations, take a look at the end of the driver for the BJ300 and use that as a prototype. Most of the entries are in decimal, a few include characters (in single quotes).

The value starting with 'p' is the ASCII value of the character to be altered (you can establish this for the screen font in use with the CHAR_TAB.CPX, for instance). You then send the escape code group to select the Norwegian character set (on my HP DeskJet 520 this would be 27 40 48 68 for Norwegian1 (ISO 60) or 49 in place of 48 for Norwegian2 (ISO 61) but this will be different on the Canon - this quite likely is the 27 91 84 4 0 0 0 3 xx used in the sample, where xx determines the character-set) followed by the ASCII value of the converted Norwegian character (on the DeskJet this is 91 for AE diphthong, 92 for crossed-O, 93 for A-ring, 123 for ae diphthong, 124 for crossed-o, 125 for a-ring) and then another escape group to return to the normal language set.

If you only have the hex values in your manual you can use these but each must be preceded by the '$' dollar sign.

Hope that helps

Regards
Peter

Good subject is'nt it. I have lots of Pompey Pirates stuff laying about that
I bought as "blank discs" at a Car boot sale. No good to me as I now run a
Falcon. But whilst agreeing that present autors need supporting & I register
everything I use.. I would agree that the old games Comercial types I mean
are not supported & no one cares the sellers have moved on to pastures new.
If they cared about a "dead platform" they could have "donated them as
Freeware" I for one would gladly donate my 600 odd Games to an archive of
historic Atari.

Pete.

3944. FS: Winnipeg Atari ST User Group fundraiser blowout!

Newsgroup: comp.sys.atari.st
Date: 1997-09-24 00:00:00 UTC
From: Trevor Cordes <trevor@cyberspc.mb.ca>
Message-ID: <34293A51.6956@cyberspc.mb.ca>
Source record: 116326
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other.systems,misc.forsale.computers.others

Newsgroups: comp.sys.atari.st

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of Atari User magazine FREE! Please specify which issues you want or random.

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

==========
SOFTWARE / BOOKS
==========

FirstGraph - professional presentation graphing for the Atari ST/TT $19
disk/docs =

Critical Path - project management software for the Atari ST $19

1040 STe - 4 megs RAM $200 =

3 1/2" external floppy drive $25 -

Epyx 500XJ joystick - minorly broken, probably fixable or usable for parts $2 `

CaTTamaran - accellerator for TT's makes them 48Mhz instead of 32Mhz, easy to
install in any newer revision TT (motherboard B and up; 80% of TT's
in existence). Previously installed in a pre-A revision TT, which
turns out doesn't work with the CaTTamaran. Comes with original
disks, manuals and extra documentation from Cybercube. Sold as is,
with no guarentee because I can't test it on a system first $30 `

Atari TT030 computer - Faster than a Falcon, perfect condition!
4MB ST RAM + 4MB TT RAM - for greatest flexibility and compatibility
135MB internal HD - excellent condition and just the right size
Atari TT VGA monitor - 14" color screen allows 256 colors (*below)
Atari mouse
Includes all original manuals, software, disks, boxes(!)
Includes unlimited tech support via email from me, a 10 yrs
experience ST user.
All in excellent condition and guarenteed to work for 14 days $600
* The monitor has recently manifested a wobbly picture after hours
of use, a good tap on the side temporarily fixes the problem. My
dealer says it probably is a cold solder joint that needs to be
tracked down. Otherwise in perfect condition and perfectly
serviceable. The package without the monitor is $550

Atari Mega STe computer 2MB RAM, 300MB hard drive $420
Everything works perfectly except the right side shift key.
Great computer.

Atari 520 STf $50 .

Atari 1040 STf $80 .

Atari 1040 STfm $85 .

Atari external floppy drive $35 .

Atari Color monitor $50 .

Atari Mono monitor $40 .

Atari external harddrive $40 .

Atari external harddrive not working $20 .

2 Wico hand-formed joysticks $10 -
1 in perfect condition; 1 sticks a little

GVC 2400 BPS external Modem $20 -

Raven Impact Dot Matrix Printer PR-9101 $25 -
2 replacment printer ribbons - KX-P115
Basics computer paper 1000-pack - 1/4 full

Parallel printer port cable $5 -

Printer ribbon reinker kit as is $15,
re-ink your ribbons! in a wooden chest - real neat!

CD-Recordable service - unrelated to STUG, it is my own company, but
worth mentioning here. STUG recently moved its nearly 1000 library
PD floppies to CD-ROM - never again worried with faulty floppies!

We can move your data or audio to compact discs and CD-ROMs! Over 800
Atari floppies per CD-ROM!

Pricing from $10 to $50 per disc depending on the data and how it is
delivered to me (ie hard drive or syquest is cheaper than floppies).
Email for more info.

Can't help you on the Falcon, though with HS Modem you can get very high port
speeds on it (in excess of 116 k). Reading the US_Robotics topic it is clear
that both the current 56k technologies only give you anything near that speed
a) inwards only and b) only if the ISP has a digital line and there is /only
one/ A/D converter between you and the ISP.

g> hard drive but all of a sudden i cant get the computer to boot from the
g> hard drive. I can boot from a floppy and load the software but cannot
g> access the hard drive.

If i were in your shoes i'd power up the computer without the HD running,
then power up the HD once at the desktop, run the Hard Disk driver from
floppy, then re-install the driver onto the Hard Disk. This should work
unless youve got something like a duff Auto or ACC program on the hard drive,
or even a corrupt DESTOP.INF. If this is the case then boot with the CNTRL
and ALT keys pressed, this should prevent the AUTO's and ACC's fromloading
and may get you back into the drive. If all this fails then you may have
severe disk corruption that may require a repartition or worst a reformat
exercise.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

My hunch would be to keep switch 10 on. When I managed to get the
Papyrus driver to work it was only by using some of the codes which
only work with this setting (specifically the FS codes). If NVDI,
GDOS, Calamus, Arabesque, Imagecopy etc all work with this set to on
(as they do), I'd assume that this is the normal setting for Atari
software BJ drivers. You could try a few standard packages with it set
to off and see if they still work, but if they are using those FS
codes they won't. I don't know the Idealist package, but if it comes
to a choice between it and the above list I'd say the list wins.

>I need to stick to one standard and configure everything else to that.
>And I certainly want the mode that gives me the most out of the printer's
>features. Obviously this only applies when using the printer by itself
>directly from applications or from the desktop (not via NVDI).
>Any idea why the comments in the "Idealist" driver said to switch DIP 10
>off?

It may be using some of the features which operate differently to when
it's in the on position, as it's really expecting to talk to an IBM
Proprinter emulator.

It's in the post! I tried it out tonight with Papyrus 5 and the main
difference (from NVDI) seems to be in printing fills: they come out
lighter (you'll like that!). Though I think this is because extra
options appear with NVDI drivers for lightening graphics and you can
play with the dither settings too, somewhere. NVDI's output looks
better to me, but the driver works with DIP switches set as before.

<snip>

[DIP switch settings]

My hunch is that they are assuming more and more users will be using
NVDI or GDOS, to the point that Papyrus 5 comes pre-set to use NVDI
unless you change it.

>>>I'll look into those drivers again, but it doesn't really make much sense

>
>But 180 dpi probably uses a lot less ink as well since it looks grainier.

Depends what it's printing. My hunch is that the dots are just larger
but roughly the same area of paper goes black. The printer is using
the same number of jets of ink, but at 180 is using four jets per dot
rather than one jet per dot at 360:

360 dpi dot: X

180 dpi dot: XX
XX

ie half the number of dot per inch but the dots are bigger and over an
area of solid black the amount of ink used will be the same, the only
variation would be at the edges where the larger dots at 180 dpi would
result in a more ragged edge.

If the BJ used economy mode for graphics (which I'm pretty sure it
can't), the 180 dpi dots would have to be printed as:

X
X

or something similar to reduce the ink usage. Which would probably do
horrid things to dithered bitmap images.

>>>How come I can't get to print in "economy mode" via NVDI. I'm sure this

>>etc is printed in graphics mode.
>
>What's "RIP"?

Sorry, it's Calamus-speak for Raster Image Processing, as in
converting the page image into a bitmap for printing, which is what
Calamus does when generating a page and also what NVDI does in
conjunction with a program like Papyrus. This contrasts to the way a
lot of PC and Mac programs print, where the page is sent to the
printer in a Page Description Language (eg Postscript/HP equivalent)
and the printer does the RIPping (so-called hard RIPping as the
printer does the work).

>>>Ah... I guess I just got a confirmation of what I thought -that NVDI
>>>outputs everything graphically).
>
>>Yup!
>
>Hmmm.... that's both good and bad. I was hoping that "normal" text was
>output in the usual way, while fonts that were different from the
>"standard" stuff inside the printer (as well as images naturally) were
>output as graphics.

Nope, that's the PDL method as described above. NVDI, Calamus etc
don't use the printer's built-in fonts at all.

<snip>

[Selecting print modes]
>From the BJ-10ex manual it says:
>
> ESC I n Select print mode
>
>Won't this have something to do with this?

Possibly, but to be honest I'm not at all sure what this does.

>I have no idea how to use it though. Obviously a number has to be placed at
>where the "n" is for which mode is to be used.

I think if you use it you just need to put the n in parentheses : (n)
and the driver will fill in the blank if it's going to work and you
can figure out what it does.

<snip>

[Character encoding/mapping]
>yeah, a real pain! On the Internet there's a (more or less) standard way of

>character set. My news/mail program ("Okami") has this built in.
>I was hoping that modern printers corresponded to some sort of ISO standard
>as well, perhaps not.

Well, the Canon seems to have a choice between different IBM character
sets if I understand it correctly: probably the closest thing there is
to standardisation :-(

: taken over JTS now?

Yep...there was a merger between JTS and Atari...
Tramiel pretty much runs the show, but not all on his own this time.
They're trying to liquidate the old Jag invetory, and of course JTS
is making hard drives.

I'm not sure what they're up to...but knowing the Tramiels, the goal
is to liquidate the two companies and pocket as much cash as possible.

I have renetered the Atari scene after a long absence and would like to find two old titles for the ST:

1) Rogue by Epyx circa 1986
2) Deep Space by Psygnosis circa 1986.

If you have them and want to sell them, let me know by e-mail at the following address:

manual-motion@worldnet.att.net

Thanks

>ofcourse any new files).
>
>How do I go about doing this? Preferrably so I can make a ".KBJ" file out
>of it?

Here's the file I use to backup my Cixread messagebase:

```
------------------------------------------------
* Backup CixRead Database

DIALOG_LEVEL = 0
GEMDOS_MODE = (abcdefghijklmnoPqrstUvwxyz)
VERIFY = ON
DATE = CURRENT
ARCHIVE_TREATMENT = KEEP
SOURCE_TREATMENT = 0
BUFFER = 90

SRC_SELECT H:
SRC_SELECT CIXREAD\
DST_SELECT F:
DST_SELECT CIXREAD.BAK\
DST_SELECT CIXREAD\
CHOOSE SE CONSIDER_PATHS ARCHIVE = SET
COPY OPEN_FOLDERS RESET_ARCHIVES
QUIT
------------------------------------------------
```

I think I created this by actually running the program and doing a
backup using "Record job".

Have a look at CardFile 3.
I'm not sure about importing DB files, it doesn't have a calculator,
but it does all the rest. You can get good calculator ACC and PRG
applications from popular FTP sites (like ftp://atari.archive.umich.edu).
You can export addresses and things from CardFile directly into most any
word processor or text editor. It has a nice organizer and alarm system
for your "To Do" and appointment notes.

Also check out Tracker ST if you can still find it anywhere...never tried
it myself, but I've heard it is the best contact manager ever written
for any platform anywhere!

and here I thought that Commodore (the company) died even before Atari Corp.
did! Meanwhile, the Amiga is doing better. In fact Gateway 2000 bought them
and are planning on expanding the line. They are building a new place for
research and development even now. (3rd party support isn't bad either, you
can get a 175mhz PowerPC accelerator board for under $600!) :)

Makes me wish we had an Afterburner PPC board for that price! :)

I might remember wrong here, but doesn't lharc expect a command switch as
first argument, that has no dash in front, as the dash is used to indicate
command dependent options ? So try

lharc x file.lzh

which should work.

This is OLD news and I'm glad to point it out: They bought the completed
versions of *TEMPEST 2000*, but not the rights to the original, Classic
Tempest. In fact, I wouldn't be surprised if Atari still had rights to
T2K, and just sold those particular versions to Interplay.

You DO need a signal to wake it up. Can't think of an easy way to test
it apart from taking your m/c along to the shop :-)

Here's and updated list of for-sale items I posted earlier to this newsgroup. A lot of stuff was sold so I needed to edit out all those items and just list what is left from the sale. Go ahead and make me an offer we both cannot refuse! Happy shopping!

HARDWARE:

PCM124 Atari PC Monitors-NEW-$30ea.

NX-1001 NLQ Star Multifont Printer-multi paper path, auto loading,prints on up to 3ply paper, original box, like new.-$30

A/B Video BOX(NEW) - 3-15 pin female jacks - A-B & Input-Output-$15
above with 2 new 15 pin male video cables-$25

SC1224 Monitors - units power on and have displays but all need different types of repair. Ask whats available. $10ea.

KEYBOARDS for Atari ST/STE(Not MEGA)-good working condition, clean, no broken keys.-$10ea.

Oivetti Ink Jet Printer Model PR2300. Includes 20 ink amples and AXIOM 32K Wordstore Printer Buffer. Original Box and docs. $20

NOW FOR THE SOFTWARE.......

UTILITIES-Business-Education- "ALL CONTAIN ORIGINAL DOCUMENTATION & BOX" ** Atari CD's **
TITLE Manuf/Dist Description PRICE

THE MUSIC STUDIO-Activision/Audio Light-music program, includes 7 music floppies.-$5

DATA DIET v1.0-Disk drive compression program-Double Click Software.-$5

MOUSE BOOT v3.d-Boot manager-$2
MULTI-DESK-Codehead-unlimited desk accessories utility.-$2

PHOTO SHOW PRO-STE v2.3-Its All Relative-Kodak Photo CD application for STE & MEGA STE.-$5(incls. Winning Pictures Viewer & PhotoKina CD ROM viewer drivers)

READ-A-RAMA-Unicorn-ages 5-8-Learning activities-$2

FUN SCHOOL #3- DATAbase-Education software-ages 5-7-$5

TYPING TUTOR-Word Invaders-Acadamy Software-learn to type on your Atari.-$5

REGENTS WORD II-Regent Software-A GEM based word processor w/Spelling Checker-$2

GAMES GAMES GAMES GAMES GAMES
All have original box and doc's!!!

DOG FIGHT-Micropose-80 years of aerial warfare-flight sim-$10

OBSESSION-Unique Development Sweden-excellet pinball games-for STE only.-$15

R/C AeroChopper-Ambrosia-Remote Control flight simulator-fly helicopters and fixed wing aircraft. Comes with an original FUTABA Conquest four channel/2 joystick R/C controller that plugs into the Atari. Comes with manual-software & original box-excellent program for

a 1-meg Atari.-$50

NAME YOUR PRICE ON THESE GAMES SW=shrink wrapped
All come with original box and doc's!!!! *Commercial Software**

METROCROSS-US GOLD-scrolling skateboard arcade game-SW

ZYNAPS-Hewson-scrolling Defender type game-SW

DRAGON SCAPE-FreeBird-ride dragon in multi directional scrolling game-SW

THE BLACK CAULDRON-Sierra-Disney 3D animated adventure game.

STAR WARS-BRODERBUND-space shoot em up.-SW

STARGLIDER-Rainbird-Futurustic Arcade 3D combat flight SIM.

CRASH GARRETT-Metal Hurlant-French language adventure-"Contient Un Badge Couleur".-SW

Micropose-F15 flight simulator.

FINAL ASSAULT-EPYX-Mountain climbing adventure.

PINBALL WIZARD-Accolade-Pinball tables & construction set.

BATTLESHIP-EPYX-High seas combat.

METROCROSS-USGold-scrolling skateboard arcade game.

PROJECT NEPTUNE-EPYX-007 role playing game.

MERCENARY-Datasoft-Flight simulator adventure-Escape From Tartg.

SENTRY-Firebird-surreal landscapes, strategy game-Gold edition.

GOLDRUNNER II-Microdeal-COOL GAME!!

CHAMPIONSHIP WRESTLING-Epyx-WWF Atari style.

ARKANOID-TAITO-enhanced Breakout style arcade game.

RENEGADE-Taito-Street fighting.

ALCON-Taito-Raiden style scrolling shoot em up.

BOBO-Infogrames-Funny Cartoon style game. BoBo tries to escape from prison.

OBLIVION-EPYX-3D scrolling & perspectives-excellent game!!

PRIME TIME-First Row-Create your own TV Network.

ZERO GRAVITY-Microdeal-marble arcade game.

STARE QUAKE-Terrific Software-arcade style 512 screens.
.

STARGLIDER- - Arcade quality 3D combat SIM.

BATTLEZONE-Atari-tank battles.

LANDS OF HAVOC-Antic

PHANTASM-Exocet-Space Adventure.

KARATEKA-Broderbund-Karate Fighting.

TRANSPUTOR-Actual Screenshots-marble game.

LED STORM-Capcom-Scrolling driving game.

ELIMINATOR-Hewson-3D graphics, arcade game.

WARSHIP-SSI-Tactical game. Surface combat in the Pacific 1941-45.

HECTOR AND THE KILLER TOMATOES-1 MEG game + Editor(excellent)

****
ATARI FORCE COMICS. First issue thru Final issue(1-20)$25
All in plastic sleeves, mint condition.

Wow, I thought there would be a lot of interest in this.. maybe some
people missed it?

(repost)

-LineAudio Jam-8 OUT audio output expander for the Atari Falcon.
Features 8
balanced line level, super high quality outputs compatible with any
Atari or
C-lab Falcon and Cubase Audio, Logic Audio, Zero-x, Audio Tracker, etc.
I'm selling it because I need to buy an ADAT interface instead for my
Falcon. It's in perfect condition and has never left the sanctity of my

home studio! I paid $450 for it, would like to get $350 for it, but I
will take the best offer (or trade for the Falcon ADAT interface). If
you don't think it's worth that, please make me an offer of what you
think it's worth.. I'll definitely consider it!

3972. NEEDED: Atari Mega 4 ST! Want to Trade(USA)!

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4. (2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs or E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an order of enough of my stock. One example, a customer ordered over $200 of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125 Mono Monitor with a Built in Monitor stand and an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive plus a modified 800xl with a built in Translator on a switch that will run older Software without a Translator Disk Plus Lots more new 8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

comp.sys.atari.st did rant to All ... here's the result...

Hiya comp.sys.atari.st....

>> This could well be the last Atari show arranged by Goodmans.
csas>
csas> I find that suprising, surely its too early to know that. if
csas> these shows are a roaring success then I would have thought more
csas> easy..
csas> Or is Goodmans leaving ?..

Mike has no plans to leave the Atari scene, please don't mistake my
posting, he is simply stating [as he did on his U.K. Atari show flyers]
that there must be a good turnout in October for the shows to continue.

He also told me this in person [well, over the phone] so it's NOT
hearsay :))

csas> what? what do you know, why are you telling us all it could be
csas> the last.. Do you know something?...

All mike is saying is that he works flippin hard to keep the shows
running, it's true, I couldn't believe the initial outlay to run a show,
he makes little or no profit from the shows and he's concerned about the
shows running him into the red IYSWIM.

He's hopeing for a good turnout at BOTH the shows to ensure their
continued success....I can't say I blame him :))

I'll be there AYK.....

csas> Come on tell ???

I just did...hehehehehe :)))

3977. 6mhz avr files for audio message on internet?

Newsgroup: comp.sys.atari.st
Date: 1997-09-25 00:00:00 UTC
From: eonic man <eonicman@erols.com>
Message-ID: <60cof6$qc9@winter.news.erols.com>
Source record: 116343

Being that most audio digitizing software on the Atari supports AVR, doesn't it make sense to use compressed, low res AVR files for transmitting audio messages on the net. What do you guys think?

Peter Ross

Hi,

> >
> >
> Thanks for the info my main question was really the reason for error message
>
> "Couldn't sync or lock device j:." what does this is mean and is it serious?
>

OK, as I understand it, when fsck runs it calls the utility
called sync. Sync is used to flush any write cache that has
not been written to disk, thus ensuring that do data is lost
when fsck runs. fsck then tries to lock the device
it is checking, in this case J: so to prevent other processes
from using the device when fsck is running.

This isn't a problem as long as you don't try to run any
other programs while fsck is checking your drive.

Does this answer your question?

Regards,

Ben Hills.

I guess the info is just wrong and it's actually Atari they are talking
about.
I guess even Amex doesn't realy have any faith in JTS, so they kept
Atari
under the name JTS. ;-)

> On Sept 8th it was said that Activision bought the writes to Asteroids

I shouldn't re-invest, so long as they doesn't blow the dust of the
computer
line and releases some nice hardware to us to buy. You can always dream.
:-)

> I bought at $1.00/share and it's selling at $0.50 as of today. There web

Hiya damien@jetman.d.c.u....

>> No, we are keeping it alive by supporting Shareware authors and paying
>> for our products..
d>
d> Oh please. The ST is dead. Some people just don't realise it.

Define DEAD?.......

To make it easier allow me to define the current state of the Atari scene:

1, Diskmags - There are currently at least 5 mags that I'm aware of and
that DOES NOT include a paper based magazine.

2, The current Atari shows - again, there are at LEAST 3 that I know of
going on over the comming months.

3, PD releases - H.E.R.O. 2 has just been released along with numeous
other games.

O.k., I'll admit theat the commercial side of the Atari scnene is far
from brilliant however, there is STILL new hardware being developed as
well as upgrades to current software.

Thriving?....no, dead?....NEVER!. :)))))

Dunno. If it helps this is what I've got with MagiC. In my setup I
just right click on a zip file and it gets decompressed using the
following command line ...

-xr %0 *.*

... where %0 is the zip file passed by the (ease) desktop, and no, I
never got it to do more than one at once either!

For lzh files I just use lharceng with no arguments..

>Will someone who understands the actual meaning of this error message please
>relate it me, preferably with little or no "technospeak"

It does mean too many open files.

Files need a unique identity - these are known as handles and at the end of the day a handle is just a number. As long as they are all different everything's ok. When no more handles can be obtained you get tos error 35.

When a file is opened the system needs to generate a unique handle. Part of this handle generation process involves grabbing some memory so that information about the file can be maintained. There is no real limit on the number of handles but there is a limit on the amount of memory that can be used to generate them and this has nothing to do with the amount of memory your machine has. Thus, lack of this "fixed" pool of memory is almost always the real reason error 35 pops up.

So far, I guess the above helps not a bit, as it makes no sense with your problem except to wonder if there is a software bug. Assuming not, there is one other thing that might - the infamous 40 folder bug. If, when it hits, you are lucky enough (and if you ain't it's bye bye data and hello corruption) to be running an application which tests filing system results exhaustively, you may see error 35 output. Who knows what Profile does internally - if it scans a lot of folders and opens a lot of files this could trigger the 40 folder bug off. The only way to see is to add loads more folder memory and see if the problem goes away.

Look out for a message from Hallvard and then visit his pages. He has
a very comprehensive collection of FAQs.

>1) Does an IBM PC Standard parallel printer cable work with the ST?

Yes.

>2) My ST came with none of the original disks... is it legal for me to
>own copies of the original disks? -- As in: Does the software license
>actually belong to the hardware, or if the disks are long gone, am I SOL?

In theory the rights belong to the software itself but I don't see why
you should not have the same as everyone else.

The big question is "Why would you want it?". The stuff that came
with the Atari was buggy rubbish. There is FAR better available PD.
You are missing nothing m8!

>3) Is there any documentation on the Internet on hacking in more memory?
>I'm no stranger to the soldering iron and could do it myself except I
>have no schematics to double-check against for any changes I may make...

Yes - again, Hallvard is probably the best primary source. You have
1Mb ATM and could increase this to 4Mb. While there are DIY hacks (I
did one myself to replace the 1Mbit PCB chips with 4Mbit) your best
solution is to look out for the Marpet store expansion board. It is
simple to fit, reliable, and takes normal SIMMs.

If you do comms one of your early mods should be to double the speed
of your serial port using a 4040 chip.

> 3a) Anyone have a TechRef or schematic set for sale/trade?

A bit like hen's-teeth!

> 3b) Other things I'm interested in purchaseing/trading for are a
>monitor cable, a SCSI board, the Crystal Castles game (if available for
>the ST) or anything else that sounds "neato."

Monitor cable? From 13-pin DIN to what?

Keep your eyes open and you will see host adapters for 20-30UKP second hand. Otherwise Link 96/97 are available new.

Out of the ether, the following was mentioned by bdc2@po.CWRU.Edu...:

b> Is there a ramdisk that is compatible with a TT that has 10 MB
b> of STram and 16 Mb of TTram? I have tried maxi-disk and HRamdisk
b> (that comes with Lattice C. Both of them seem to load at the 4 MB
b> boundary,
Well i've just tried Flexdisk on both my TT and Falcon and in both cases it
created the ram disk in fastram.

On the TT I was able to create a 12Mb ramdisk in Fastram, which left me with
just under 4Mb of STRam (sorry don't have 10Mb to test with on the TT). Stuff
runs from it just fine as well.

On the Falcon I was able to create a 14Mb ramdisk in Fastram leaving about
12Mb of STRAM and the same tests passed with flying colours so the
68040@40Mhz didn't cause any difficulties.

Now the only flies in the ointment were that I couldn't persuad the ram disk
to install if I were running Magic v4 and I am unsure of the distribution
policy (my copy came with Ease which is a commercial desktop replacement).
Also it seems unable to install in a drive
beyond P:, whereas the likes of Extendos can install beyond P: without Magic
loaded!

So what will happen to the computer part of Atari, which after all
was the major buissnes for Atari the last 10 years and which was
very profitable for quite some time?

Will someone get their act together and buy the rights for TOS and
the Falcon? ARrghhh... why isn't anything happening? Is it only the
Amiga folks which should have some fun in the future? Why not us as
well? Who cares about some old dusty games? :-)

Does anyone know what happened to C-Lab and where I should point
my missle?

The more I talk about this, the angrier I get. :-((((

Try Computer Direct in Canada, or B&C Computers in US. I haven't got
their adresses, but I bet someone else has. It would ofcourse be much
cheaper to look for one second hand. Aksing for one in here would
probably do it. Get a Falcon030 or TT.

Oppss.. I don't know much about this. I guess there are versions of
PINE for Mint-NET. You could also try different STiK-Clients. I bet
that someone can answer this better as well.

> Word Processing with Spell Checking and hopefully allows for
> a wide range of print drivers for different printers.

Well there is only one. Papyrus. Not very cheap though, but very good.
Try the above companies.

> Math software to allow me to do calculus-deep calculations which
> also stem from Trigonometry, Linear Algenbra, and Calculus

There is one great math program called 'Euler" (if I remember
correctly).
It's something like Mathematica but it's freeware. The Atari version is
not supported any longer, but the last version released was realy good.

> 2) Where can I get a copy of Loom? I am looking for a Mint copy

I have no idea. :-)

Yes, it should, the problem might be getting the printer to do anything
more than plain ASCII without SpeedoGDOS or any other GDOS. You'll need
GDOS and a GDOS printer driver

>

As stated in the Quick FAQ, the original disks are quite worthless. The
only useful thing that came with them was Control.ACC, which was later
replaced by XCONTROL.ACC and can be found on the most FTP sites.

Most FTP sites carry a file about adding SIMM sockets to a plain old
ST/STF.

Crystal Castles was a Mac game, right ? Never heard of an ST version.
SCSI host adapter cables are available from most Atari dealers. There
are a few adresses in the Quick FAQ.

Tony, posting binary files in non-binary newsgroups is absolutely
against netiquette. Especially when it's commercial software, old but
still under copyright.

Please do not do this again (I don't think you will after all the flames
you're probably getting for this...).

Postmaster, please educate your users about netiquette.

This is a common problem. The mouse steals CPU-cycles and the serial-buffer overflows.

> Anybody know a solution ?

Use a lower DTE-speed (19200 should work fine on all ST's), and install HS-Modem. HS-Modem installs faster/more efficient serial-routines and doesn't suffer from the overflow-problem to the same degree as the standard.

I also found that if I ran my comms-programs under MagiC, I could use 115200 without problems on a standard Falcon. With TOS/Geneva the limit was 57600, even with HS-Modem installed.

I'm now using an accelerated Falcon (with Afterburner), and I can now use 115200 without any problems with all applications/OS's.

Not much better than Atari I'm afraid. Commodore (unlike Atari) didn't make any games though, so this is pretty irrelevant.

How about, programmers read mostly c.s.a.st.tech while average people
usually don't bother with it? WHERE should one post then? What about
the fact that NONE of the STiK clients handle cross-posting, meaning
one must re-post twice instead of just once, when the message could
apply to both newsgroups?

>comp.sys.atari.st Discussion about 16 bit Atari micros.

> ...is not enough?

There really should be a comp.sys.atari.falcon but, technical
questions could all be sent to c.s.a.st.tech (should really be
re-named comp.sys.atari.tech to be more generic).

4001. FS:TOAD P133 System

Newsgroup: comp.sys.atari.st
Date: 1997-09-25 00:00:00 UTC
From: defang@ibm.net
Message-ID: <342A7B46.481@ibm.net>
Source record: 116367

Before I place this ad on the NET I wanted to ask any Atari users if they would like this system. It was put togeather by TOAD Computers plus additions I made and is in real nice shape. Just boot it up and off you go. I know its not an Atari computer but just wanted to ask here first. Here's a list of what it's got:

TOAD Chameleon System

Pentium 133-socket 7 with heatsink and fan
32 MG. Ram
256K cache
1.2 GB Hard Drive
Matrox Mystique 2D-3D Video Card with 4 Mg. Ram
SoundBlaster AWE 32 soundcard upgraded to AWE 64 via Creative Software--WaveSynth/WG- CD included(upgrades AWE32 to AWE64 compatible)--comes with 8 MG memory on board - 4 MG SIMMS X 2(30 pin)
ZOOM K56FLEX Fax modem-internal-model 2819 PnP
8X Speed Creative CD drive
Eagle 96 Exabyte Tape Backup System with excellerator board and 4 backup tapes 1.6 GB uncompressed 3.2 GB compressed per tape--(4 Tapes-Verbatim MC3020 EXTRA)
1.44 Floppy drive
Spacewalker HOT-541 motherboard-includes VRM Module so you can put an MMX CPU in it.(more specs. to come on motherboard)
(Motherboard Spec's:Intel PCISET, Memory-up to 128MB, 246KB cache-up tp 512K, 32-bit PCI bus slot x 4, 16-bit ISA bus slot x4, 2-channel PCI IDE port, supports up to 4 IDE devices, one floppy port, one parallel port-SPP/EPP/ECP, 2 serial ports-(more info at www.shuttlegroup.com)
VRM-HOT 106 voltage regulating module 553/MMX Power Regulator-installs in motherboard next to CPU-plugs-in.
Joystick
Speakers-under monitor-3 speaker-A-B mixing-"headphone jack"-RCA phone jack inputs-Tandy model MMS-10
Beetle Mouse-serial 3 button mouse
Windows 95-installed * Encarta 96* MicroSoft Works* Microsoft Money-CD's included.

Tower case-16.75" long 13.5" high 6.75" wide

Nice all around system---ASKING US$1200 + Shipping. US & Canada ONLY!!

4002. Atari monitor - is it dead???

Newsgroup: comp.sys.atari.st
Date: 1997-09-25 00:00:00 UTC
From: Daniel Woodard <woodardd@dma.org>
Message-ID: <60dlulihd1@sally.dma.org>
Source record: 116368

I saw what looked to be a nice Atari monitor at a thrift store yesterday. I believe that it is the type that was used with the ST. It powers up, as evidenced by the power light, and you can hear that high pitched noise that all monitors make when they power up. However, I messed around with the brightness knob on the right, hoping to get the monitor screen to blaze white. I couldn't get anything to appear on the screen at all. Does this mean it is dead, or does it need a signal before you can get anything to appear on the screen?

Thanks,

Dan

4004. Atari show in Dallas - update

Newsgroup: comp.sys.atari.st
Date: 1997-09-25 00:00:00 UTC
From: smedley@gte.net
Message-ID: <60dv15$6bt$1@gte2.gte.net>
Source record: 116370
Cross-posted to: rec.games.video.atari,rec.games.video.classic,comp.sys.atari.st,comp.sys.atari.8bit

Here we go! I finally have a list of vendors committed to attending the show. Chromagic, Crawly Crypt, Systems for Tomorrow, Emulators Inc (formerly Branch Always Software) and More Than Games. These names should all be familair to you ST computer fans out there. For the Atari gamers, Systems for Tomorrow also sells 2600, 7800, Lynx, and Jaguar games - contact them if you would like them to bring along a specific title for you. Sorry XL/XE fans, as far as I know none of these guys carry products for the older Atari computers. Hey, believe me, I e-mailed both Best Computers and B&C Computervisions to try to get them to attend the show, but neither could. (Come to think of it, I don't remember if Best even replied... I wonder if the address I used was any good?) But come on by anyway, meet some fellow Atarians and maybe strike a few trade deals. (And yes, fellow gamers, I will have some trade fodder along if you wanna wheel & deal!)

The show is on Saturday, October 11th, at the Infomart in downtown Dallas Texas. For directions or other info, contact:

Dan Mazurowski smedley@gte.net

Perhaps I should send you a tape with some sublimal "KGMD, KGMD, KGMD..."
messages ;-)

> Zip works fine with single files, but how come I can't decompress several
> files in one command stroke, like this:

> zip -x images.zip files.zip another.zip

Don't know, sorry. I rarely use zip.

> And "Lharc" simply wouldn't decompress at all! I tried the following:

> lha -x file1.lzh

> and it compressed "file1.lzh" and made it into a file called "-x.lzh"!!!

That's because lzh (I guess you're using the ttp-version from the LZH-Shell
distribution?) doesn't use "-" in the switches! (Like zoo) Try 'lha x file1.lzh'
instead. This is how it works on all unix-systems I've tried it on, and
it certainly works here.

> >> better than CRACKING the game. Because that is surely unlegal.

Cracking isn't illegal. Spreading cracks are. Selling second-hand software is also illegal, atleast here in Norway. It doesn't matter if I throw away any backups I have and sell the original, the way the copyright-laws works here in Norway it's simply not possible to sell your legally bought software again... It sounds incredible, and I didn't believe it myself until a friend of mine (He currently studying law at the university) confirmed it.

> >What kind of software do you use for copying games?? I've tried Fastcopy (various

> I use ProCopy (A special version) and if that doesnt work i use MSA.
> And if that doesnt work either, i copy them on a Pc :-)

I've checked this again, and neither programs will copy any of my originals! I don't have your "special version" of Procopy though, but I can't imagine it'll work either. Games are protected in many ways, like using strange sync-bits, different number of sectors on different tracks, "corrupted" tracks etc. Most games can't be copied without extra hardware (Blitz-copier) or by cracking them.

A straight copy works sometimes, but most of the time you'll discover that the game crashes at level three or something because of missing/corrupted data.

The only sure way to copy disks are to read each track as raw data and write it back to another disk. This is how it's done with professional copiers (like the ones used by publishers), and the Blitz-copier was an attempt to do this on the ST.

I'm still very interested in how you managed to copy all originals with just plain copiers...

> >If you want to make a copy of e.g. "Magic Pockets" the only way is to crack it,
> >unless you're some kind of a wizard.

> No need to be a wizzard...

Well, I can't copy it, and I believe I have more knowledge about Atari-computers than the average game-player ;-)

> > Hell you can even go into any decent shop
> >and buy CD's with Amiga-versions of the very same games that I want to give
> >away for free! Do you think that "Electronic Arts" or "US Gold" care?

> They dont care, but they have given their promission offcourse!

No they don't. The big publishers doesn't care about their old releases anymore. I know that efforts has been made to get permission to distribute old ST-games as freeware, but so far they haven't even replied.

> >I guess that you and other moralists rather see that the ST-community
> >dies

> No, we are keeping it alive by supporting Shareware authors and paying for our
> products..

This is the "I don't need no PC my Atari's still doing the job"-community. I'm a part of it, and I write software myself. I'm talking about the "have PC and an old ST in the closet"-community, who's now playing ST-games on their PC with PaCifiST. In the long term, the latter is the one that has a chance to survive, as long as the games are available.

Thanks to those who responded to my previous posts,
my MEGAFILE is now sold! ;-)

The following items remain FOR SALE/TRADE:

* 4160 STE (TOS 1.62, 4 Mb) ==>> ie: 1040 STE @ 4 Mb
* MEGA-ST 4 (TOS 1.04, 4 Mb)
* SLM 804 Lazer Printer
* STM 1 Mouse
* Softwares
DTP: Timeworks - Publisher
Soft Logic - Publishing Partner
Music: Dr.T - D-50/D-550 Editor
Dr.T - D-10/D-110 Editor
C-Lab - Notator SL 3.1

Offers from C a n a d a and U n i t e d - S t a t e s ONLY!

Preferably TRADE against following products WANTED (I need those):

* MEGA-STE (TOS 2.06, 4Mb Ram, Internal HD)
* STacy 4 (TOS 1.04, 4Mb Ram, Internal HD).
* Crazydots-2 graphic card for TT (or equivalent ET-4000 card)

NOTE: Canadian banks cause troubles for cashing foreign currency
of any kind, including American. This can be avoided by an
electronic fund transfer (Western Union or similar), which
is usually cleared within 48 hours of transaction.

Nonetheless, if you're interrested in trading your MEGA-STE
or your STacy, we can arrange something, as no money would
be trading hands accross the border.

Complete list of items I'm selling or looking for on my homepage.

I bought an external keyboard kit for my Falcon, it works great.. but I was curious if anyone knows the maximum length of cable I can run between the keyboard and CPU? I wanted to put the CPU in another room from my music studio.

It seems to use a standard 5 pin DIN (MIDI) cable, so before I run out and get the necessary adapter, does anyone know?

Thanks..

-Mark

: If the original disc is starting to get bad, then copy it. Or make as a rule to
: copy your original disc as soon as you bought a new game or utility software.

Just a few points... First, most copy protected stuff that I own requires special hardware to backup. Most people don't have that hardware; that hardware is no longer available. Secondly, when a disk is starting to get bad, it is probably too late to make a working copy of it. Last but not least, backups will still not run from the hard disk. The fact is that if I could run my favorite games from the hard disk (Dungeon Master, Chaos Strikes Back, Stunt Car Racer, Robocop 3, Epic, Grand Prix, etc...) I would still be playing them.

Copy protection and the innability to run games from hard disk did a lot to kill the Atari games industry, especially when the same games were released for PC with that ability, MIDI music, and cyberlink capability.

If I had any idea how, I would try to alter these games to run from hard disk myself.

>
> Peter Ross

In theory yes but...

You suggest compressed files. This is a major problem with audio
data in that it generally doesn't compress well. (Just look at MPEG
compression ratios for video and then the ratios for audio and you
will see what I mean) The files would still be quite large and so take a
while to download for anyone connected to the net with an Average Atari.
(ie non accelerated STE's etc)
Because of poor compression of sample data you would be looking at
about 4.8k per second of sound at 6khz

Anyone using an STFM will not really be able to playback these
messages while doing anything else as they have to use their own sample
replay routines rather than just setting the DMA registers up and this
takes up quite a bit of processor time.

>Subject: 6mhz avr files for audio message on internet?

BTW 6mhz would be an amazing sampling rate :-)

4022. Given up on Oasis 2.10

Newsgroup: comp.sys.atari.st
Date: 1997-09-26 00:00:00 UTC
From: obroadway@cix.co.uk
Message-ID: <875315987.17707.0.nnrp-09.c2de4f5e@news.demon.co.uk>
Source record: 116188

I'm afraid I've had to give up on Oasis 2.10 (and hence, for the moment at least, NewsWatch - sorry, Gary). I've had difficulty getting it to acknowledge that there was any mail in my secondary mailbox (one which I had set up to hold mail from a mailing list) although it was indexing the mail and putting it in the appropriate files. But the last straw came just now, when it threw away what was a very important mail (judging from the subject line, which is all I saw of it) without so much as an error message.

So I'm back with Newsie. Now all I need is a program to download the news headers and allow me to select offline which articles to download in full the next time I log on. Any takers?

Ollie

>Nothing to do with memory
>Nothing to do with your ATARI or ATARI operating system,

I've seen LOTS of TOS ERROR 35 when programs can't be loaded because they weren't compatible with the machine's TOS version and I guess this is where the problem lies.
In some cases, I've tried changing back to an old TOS (the safest ones seem to be 1.02 or 1.04) and after the change, the programs with TOS ERROR 35 worked like clockwork...
I didn't read the original message, so I don't know if more info about the computer was given there, but maybe this tip might help...

Best regards,
Claes

FALCON BASED DIGITAL AUDIO RECORDING SYSTEM

In excellent working condition. Check carefully for the items. They are good and the best on their category! This system works fine and you will be able to produce your music in the digital domain. Whether sequencing or audio editing, it performs fine.

1. Falcon 030 with 16 MB RAM. All required Steinberg audio & timing fixes have been done. Line level audio in.
2. 2.5' 60MB IDE Hard disk
3. Wizztronics DEKA interface for using external keyboard
4. Honeywell keyboard
5. Beetle mouse
6. SCREEN BLASTER II (for higher screen resolution)
7. Wizztronic Cart Master LIte (allows plugging in two cartridges at once) (for Cubase and Zero-X)
8. Monitor adapters for VGA and Atari Monitors.
9. Steinberg FDI (DSP PORT Digital interface for digital recording: DAT; CD, etc.!!)
10. External 1GB SCSI (no thermocalibration) Seagate hard disk.

SOFTWARE:
(all are original disks & include manuals)
STEINBERG'S:

1. Cubase Audio V2.06
2. Studio Module
3. Cue Trax
4. Style Trax
5. Data DAt (for backing up files to DAT)

---

6. Zero-X (Superb sample editing program)
7. BAnd-In-The-Box
8. ExtenDOS PRO 2.4a (CD-ROM driver with direct CD record to hard drive)
9. HD Driver 6.0 (Best Hard Disc manager for Cubase Audio)
10.ICD SCSI PRO Utilities 6.55 (covers things not handled by HD Driver)
11.XBOOT (Wonderful program launcher)
12.Diamond Edge II
13.Diamond Back III
14.Steno
15.Stalker
16.Image copy 4.0
17.CD-ROMS & MORE software.

Price: $ 1350 OBO./ No hard disk $1150 Repply to fpinto@byu.edu for more details. Phil.

Ah, it the size of the markets made it a different situation. Let's say,
at a conservative estimate, that 10% of all the games sold were copied.
With the amount of games being sold for the PC, that was a drop in the
ocean. Not so with the Atari market where 10% (or more) would be a sizable
chunk of revenue to lose.

I'd like to second the vote for Harlekin. A superb piece of software which is only redundant on my system because of the lack of long filename support, which I need for editing my web pages. The ability to call up a text editor, calculator, information manager, resizable ramdisk, etc, etc, etc all from keyboard shortcuts within any GEM app cannot be appreciated until you use it.

Also the replacement fileselector is vastly better than the Atari original (but not as good as Freedom 1), and the ability to record system-wide macros is a godsend to programmers, or anyone with a lot of repetetive typing to do.

Cheers,

Xav

I tried it with my old SC1224, and it was indeed very, very black until
I switched on the Mega. The SC1224 is extremly dark, I have both contrast and
brightness on max all the time. The colours are excellent though, much better
than the Commodore 1084S which I also have (OK, so I collect a lot of old
sh*t! I even have an Amiga 500...).

Since the SC1224 is a 15KHz monitor you need a videocard that can be connected
to a TV or something. Very expencive, you're much better off with a cheap,
second-hand 14" SVGA (Which you should be able to pick up for ~$50-60) and
a second-hand ISA graphics-card (~$10-15).

4039. Help! TOS v1.40 Versus ZIP Dr

Newsgroup: comp.sys.atari.st
Date: 1997-09-26 00:00:00 UTC
From: denr@denr.demon.co.uk
Message-ID: <875283552_OASIS_@denr.demon.co.uk>
Source record: 116265

I am limited to the amount of data I can write to my ZIP disc and I don't know why.

My setup is: Atari 1040STFM with 4meg RAM and TOS v1.4, connected, via Link97, to an Iomega ZIP Drive containing a ZIP disc formatted tofour 25mb partitions, which in turn is connected to a Syquest exflyer Hard Drive containing a 230 mb removable Hard Disk which has 9 partitions of varying sizes.

The setup is "controlled??" by HD Driver v6.13 and I have allowed for 400 folders!

I was copying a great deal of FaST Club Software to the ZIP disk when the system refused to copy any more files to the first ZIP partition (L).

The first system message was "Invalid Copy Operation".

I rebooted and again tried to copy to "L", this time the system message was "ACCESS NOT POSSIBLE TOS terminated the operationt"!

At this stage the ZIP partitions contained the following data:

Partn L Partn M Partn N Partn 0

Folders 256 185 174 260
Items 930 648 791 1,085
Bytes Used 10,329,088 8,537,088 9,257,984 13,187,072
Bytes Available 14,726,144 16,518,144 15,797,248 11,868,160

You will see that TOS allowed me to write more data, without an error message, to Partition O.

I decided to keep writing to Partition O until it was filled or I got an error message!

I got the "Invalid Copy Operation" when Partition O contained the following:

Folders 275
Items 1,134
Bytes Used 13,737,984
Bytes Available 11,317,248

I don't know enough about either ZIP Drives or TOS to sort this problem out.

Any "knowledge", advice etc would be appreciated.

It may be relevant to note that one of my Syquest Hard Disk Partitions has had 283 folders, containing 1,138 files, totalling 22,990,848 bytes written to it with no problems!

I know, but I realy hate all this junk mail I get and it started to get
pretty
much I must say. It has become less since I added the "*" to the email
adress.

It's also annoying to miss message, but most annoying is this f*****G
netscape!

You are not in any killfile as I have no. :-)

Well I looked around and it looks like you can propose several groups at
once (in one "calling to vote" message). You have to vote for each
though.

Does anyone have know roughly how many are reading the atari groups?
I still think that some mailinglist has to be sacrifieced to be able to
get the new groups going, or people will still only subscribe to the
mailinglists and ignore usenet.

>Do you wanna bet on that ??

Please.. enlighten us all as to how you circumvented FTL's protection.
I'm sure most would be genuinely interested considering this is no
mean feat.

>>Think about it logically - if it was SO easy to copy games with just a
>>modified version of Procopy then there would have been no need for a
>>piracy scene at all.
>
>There has never, and will never be a need for piracy.

avoid the question why don't you?

let me rephrase.. "if it was SO easy to copy games with just a
modified version of Procopy - why did software houses bother to put
protection on their games?".

>>True. The ST itself is far from dead, the Atari community as a whole
>>is still quite vibrant in a muddy, slow trickling sort of way. But the
>>commercial ST scene is very dead.
>
>Games yes. Utilities no.

Pedantic!

Okay the ST *games* scene is very dead, considering this entire thread
was about games and all my references so far were to games I wrongly
assumed you'd understand I meant the ST games scene is dead. Obviously
not.

>> I don't care if a handful of PD
>>libraries sell second-hand games,
>
>You didnt care when the market was good either. (When there was new Atari games
>released every day) so why should you care now..

You actually have no right to make sweeping generalisations like that, but then this is Usenet; comes with the territory I suppose. Anyway I owned and bought a LOT of ST games when I had my ST. I was never really into the "piracy" scene, I was more interested in demos and disk mags. I'm not saying I never had a Pompey menu pass through my hands at one time or another, but I didn't use to trade in it or avidly collect all menus or sell them to others. So I have no worries that during the period the ST was vibrant I supported it whole-heartedly. But it's not anymore, I don't own an ST anymore and I want games for PaCifiST so I copy (and openly supply) them because originals would be dick all use to me anyway (the protection and disk formats rendering them useless on a PC most the time).

>>some of the newer STE/Falcon titles, but Damien's point was that the
>>STFM games market is DEAD on a commercial level (and hell, even on a
>>shareware one too.
>
>That is a blatant lie. (Shareware)

List me more than ten Shareware *games* released that work on the STFM released in the past month. No, let's be generous.. released in the past 6 months. Oh and don't include anything developed by Tony Greenwood because I fully attributed his work in the original post (which you seemingly erased).

I'm not talking about Falcon or STE enhanced games here either. I know full well about the Falcon/STE releases and how good they are, but it's irrelevant as they don't work on the STFM and that is what PaCifiST emulates.

>>commercial level in most countries. If it wasn't then we'd still be
>>able to go out and buy ST Format or any of the other great Atari
>>magazines
>
>Then what about Atari Computing ? Oops, seems like you forgot that one..

Atari Computing - is that available from my local news agents? Is it available from ANY news agents? Most the best information for what little is left of the Atari world comes from disk mags - of which there are still quite a few released (and well written). But it doesn't stop the fact that I can't go down town and find *anything* Atari related in the shops here. I wonder why?

>>finally being finished. Things move on and no amount of words will
>>stop them.
>
>Words no. Action yes.

Think this one over for a minute.. there are *lots* of emulators available, they emulate everything from arcade boards to the Genesis to SNES, hell even basic Playstation ones are out (and I mean basic). Have Sega taken action against those sites distributing ROM images? Have Nintendo? Now I know for a fact they stomped down hard on a BBS

run in Florida that was selling CD-Rom's with the ROM's on, but to
date - that's pretty much it.

In some countries you are not *legally* allowed to sell second hand
software (or make backups of it) - this means those people selling
their old ST games are breaking the law. Yet you don't care about that
- the games available for download are not being charged for, there's
no money involved - at any stage. Which is more of a crime? Someone
profiting from it, or someone doing it for free so others can enjoy
running old games on their *PC's*.

>>Share and enjoy.
>
>Pirate and destroy.

Destroy *what* exactly?

Hi! (my first post to this group)

I'm looking for an application that can convert standard ST graphics formats
to standard PC formats, like .BMP or .PCX.

Or, if it is simpler, a converter from say, D.E.G.A.S. to .JPG format?

Please advise.

Thanks.

From: ab078@sfn.saskatoon.sk.ca
Message-ID: <60f1p9gdg1@missing.its.to>
Source record: 116271

My 486SX PC only has a monochrome monitor with a hercules card and I
can't afford a color monitor. Is is possible to connect my Atari SC1224
color monitor to my PC? I know the resolution of the SC1224 isn't very
high. I'm not expecting SVGA or even VGA, but could I get a display
equivalent to EGA or CGA? If so, what would I need? I assume I would
have to cut the cable monitor cable and wire a different plug to it.
I would also need some kind of color video card for the PC.
You're response is appreciated.

I bought a Power Computing Ultimate Cartridge some years back. I thought it useful for hopefully adjusting the content of my KO2 Player Manager team files so as to reduce the 'weighting' against me and continually getting sacked!!

I never did anything with it as I never understood what the hell I was looking at on screen!!! Thousands of pages of code bollocks!

It does however grab graphic and sound sections from games etc... I've done that...

Anyone else used this or others...

Mark

..one of the most addictive games - which I got a year ago and play still - is RISK. If you ever played the board game then you'll love it. No joystick needed.

Also a game I got some time back and thoroughly enjoyed was RUNNER. Got to level 15... Shame it doesn't save levels! Working through requires a lot of time on your hands. Mine was a lonely Christmas period when unemployed and no woman!! (or money!). I sat with a hot water bottle and blanket huddled up by my ST... Bought the game for a pound just prior to Christmas...it was a lifesaver!!

I know there's quite a bit of hardware for the "power Atari users" -
Falcon in other words. Not so sure about ST hardware though! Nemesis
board rocks :) but it's on the Falcon.. strange that.. people are
developing hardware and good software for the Falcon but not the ST..
I wonder why? :) If PaCifiST could emulate a Falcon perfectly maybe
everyone would have something to worry about.. (killing markets, etc)

> That sounds really stupid.

Here in Norway you doesn't pay for the software itself, you pay for your
right to use it. This right is personal and can not be sold or given away
to anyone else. If you do you break the law! It's stupid, but this is how
it is. Norway isn't the only country who practise the copyright this way
either.

> >> I use ProCopy (A special version) and if that doesnt work i use MSA.

> It does. And if it doesnt i copy them on my PC.

How? HOW? Most (if not all, I can't remember) of my originals are
completely unreadable on any PC, unless you have some dubious copier
(Read: "cracker"). I had a copier on my Amiga once that read raw tracks,
it could copy about one third of my ST-originals.

And you state that if ProCopy doesn't work you use MSA!?! This must be a
very special version, as the original only reads sectors and fails if
they're not completely standard. It fails if there are various amounts of
sectors on different tracks. It most certainly fails if the disk has
non-standard sync-bits. Generally it fails on everything that's even
slightly protected.

The point is that originals can't easily be copied by anyone. If an
average games-player (not many of them left on the ST though, I know only
one) want to backup his originals he simply can not do that.

> >Well, I can't copy it, and I believe I have more knowledge about Atari-computers than

That's the crux of the matter. The shows take a lot of effort to arrange and a lot of money is needed to pay for the venue hire. If hardly anyone turns up (as happened in Glasgow in the Spring), then these could well be the last shows Mike organises.

> He's hopeing for a good turnout at BOTH the shows to ensure their
> continued success....I can't say I blame him :))

If the UK Atari users want any more shows after these two then they must say so by making the effort to turn up at either Birmingham or London. I know it's a long distance for many people to travel, but these events need the support of all Atari users.

So show your support and turn up!

Kind regards
Mike Kerslake

External keyboard kit? Seems like this should be an AT-Keyboard interface.
In that case I'm not sure, but an external Atari keyboard works OK with a
6 meter unshielded cable.

4059. HELP!! HELP! 520ST

Newsgroup: comp.sys.atari.st
Date: 1997-09-27 00:00:00 UTC
From: Jeff Thomas <Yanni@mindspring.com>
Message-ID: <01bccb86$7d258b80$7b0456d1@jeffthom>
Source record: 116136

OK.. I now have two 520ST and three drives and still can not get them to work. I finally got a manual with on of them today. When I turn my system on, it takes about a minute to come up. I dont have any startup disk... The manual states I need to have a disk with Control.acc and Emulator.acc files. I dont have this. The system still comes up woth two floppies on the screen. I can put a disk in the drive and it says o bytes on disk. I know that there are files on the disk because I just took them out of an old Start magazine and they had never been opened. Where can I get the start up disk or do I need this disk? I would love to see this thing in action but I have taken me six months to find a second machine..thinking that me first one was not working...but this one is doing the same thing.. I can goto to desktop and is says GEM and TOS but no version #.

Thanks in advance for any information.....

Yanni@Mindspring.com

From: lmcclure@delphi.com
Message-ID: <342d62f5.3392834@news.delphi.com>
Source record: 116138

I have been looking for a website that has the pinouts of the internal Falcon030 expansion connectors, to no avail.

If anyone knows of a website or FTP site that has the pinout data, this information would be much appreciated.

Likewise, if you do not know of of such a site, but have the pinout info, feel free to post it here and/or e-mail it to me.

: Anyway, if this is the case, there's not much you can do, since Steiberg
: seems to no longer be supporting the Atari versions... and even less the
: old 2.0.

While it is true that Steinberg doesn't release future versions of CuBase for Atari any longer, my experience has been that they will do their very best to supply you with a new dongle, or repair the old one should this be your problem. Of course it may not be a free repair/replacement, but it should be much less than buying a complete package new.

I recently got a service pack for CuBase Audio Falcon to upgrade from 1.0 to 2.6, and they were very kind and responsive in getting what I needed to me.

I don't recall the exact url, but do a web search for CuBase, and check out their north american web site. From there you can email your needs and you should see quick response (at least I did). Don't be suprised if you get a response asking about your registration status...in my case, I'd not registered mine, as it came in a bundled falcon deal with no cards so I assumed the dealer had done all this for me. They requested my serial number, or a fax be sent of the the manual cover/dongel, or some other proof it was a legit version, and from that moment on, they've been very helpful to me.

It must be SCSI Zip drive, the parallel version won't work. As for
utilities, good old HD Driver should do fine, and uses all the features
offered by Zip drives.

: There's Signum! 4.5, too.

Ummm...don't forget LeRadecatur, That's Write, and Atari Works...all
use GDOS, so you can pump in all kinds of fonts and printer drivers.

Also, don't rule out the possibility of a full DTP package...
PageStream is really inexpensive these days...less than $50 (US) if
i'm not mistaken.

This is in the Quick FAQ. Gemview is good choice. I beleive Speed Of
Light should be able to do this too (however I think the unregistered
version is limited). They can be found from the umich FTP site.

I use the BJ10xe with NVDI

DIP 1 ON for the auto sheet feeder.

dip 11 on for the epsom mode and use the epsom LQ driver in NVDI or
Speedo. the cannon driver does not work properly.

In the manual it says it is really BJ130e with dip 10 on and dip 11
off. To use the printer in cannon mode you really need a BJ130 driver.

I found the EPSOM LQ mode gives better results anyway.

> How do I go about doing this? Preferrably so I can make a ".KBJ" file out
> of it?

This one works on my machine (STE with TOS 1.62) and should work with any version of TOS from 1.4. This is because it relies on the archive bit being set when a file is created/modified. I don't thing TOS 1.2, or less, set this bit correctly.

I've used the 'open_folders' option when copying the files, so that if the same folders exist on the destination, the contents of those folders won't be deleted.

The 'keep_flags' option was used to ensure write-protected files are kept that way after being copied, as are hidden/system files.

The 'reset_archives' option resets the archive bits, so the files won't be copied again unless modified.

The 'keep_sequence' option keeps the sequence of files the same on the destination drive as they are on the source drive. The only exception to this will be when a file already exists, where it will be replaced.

```
--------------------------------SNIP--------------------------------
* job to copy new/updated files

DIALOG_LEVEL = 2
GEMDOS_MODE = (abcdefghijklmnopqrstuvwxyz)
VERIFY = ON
DATE = KEEP
ARCHIVE_TREATMENT = CLEAR
SOURCE_TREATMENT = 0
BUFFER = 90

SRC_SELECT C:
DST_SELECT D:FTP\PICS\TEST\
CHOOSE SI CONSIDER_PATHS ARCHIVE = SET
COPY keep_flags reset_archives open_folders keep_sequence
```

```
--------------------------------SNIP--------------------------------

The only things to alter would be the source drive (SRC_SELECT) and the
destination drive (DST_SELECT)

If you want to do a multiple drive copy, duplicate the block from SRC_SELECT
to COPY, setting the new source and destination paths.

Yes....I used to have this problem...the machine seems to give priority to
the mouse port , 'forgets' about the transfer for a micro-second , and then
the comms program reports a CRC error...

that was before I got an T28 accelerator...it can handle both now.

I've used Signum! 1, Signum! 2 and Signum! 3 a lot, but I've never seen
Signum 4. Versions 1-3 had at least one major shortcoming - the
search/replace functions. There was no way to make the program realise
that "a" and "A" are two forms of the same letter. Searching for "and" the
program could not find "And". This made Signum next to useless for serious
word processing. Is this problem still there in Signum 4?

Just curious...

> of it?

It's deffinitely possible and I was just about to dig out my Kobold manual but then I remembered I'd sold it...to you! I think all you need to do it select record macro (or whatever it's called) and just do exactly what you want it do. Select the source and destination then there is an option I belive called "select Files" which bring up a dialog, check the "Difference" box and on the last option choose "Select Paths" then copy. You then choose replace all, repeat for every partition. @ things though, you may need to edit the script a little by hand, I remember there being an option to set what type of warnings you want to recieve, turn the overwite/name conflict warnings off. Also I used to do all of the above and then for each partition I would swap the source and destinations around, select the difference again and then delete. This should ensure that you get a perfect mirror, eg if you had a file RUBBISH.TXT last time you backed up but then decided you needed to delete it, this will ensure that it also gets deleted from your backup and so saves you some space.

I hope this works, if not then give me a mail as I know it is possible, I did it myself.

You mean he wants to access the net at 1200 bauds ? Not very realistic
IMO. Why not get a 14400K modem (a plain ST needs a small hardware mod
to use 28800) which should work fine, and costs next to nothing
nowadays.

> Or, if it is simpler, a converter from say, D.E.G.A.S. to .JPG format?

Imagecopy can convert from most standard ST formats, including DEGAS,
into various formats including BMP, PCX, and JPG.

The fact that POPwatch's connect button does nothing, points to CDVALID not being set to TRUE in the STiK configs and POPwatch being configured to check for that before trying to connect. NEWSwatch doesn't have the same code.

Check your STiK default.cfg. Read POPwatch's docs, and check POPwatch's preferences accordingly.

Hope this helps.

>Anyway, apart from this, and the main code now being in the TSR rather
>than the accessory, I couldn't detect any difference between the two

There are no significant improvements. STiK 1.13 TSR doesn't work too well on multitasking o/s's though. And as said before, it is a *beta* that is not meant to publicly available.

>Later: The POPWatch problem is worse than I thought: the new dialer
>seems to "taint" the original STiK accessory somehow, so that after the

>started first. What on earth is going on here?

Hmm. No idea. TBH I wouldn't worry too much about it (I'm not going to). This version of STiK is not meant to be used!! So if you are getting problems with it then your only solution is to switch back to 1.12 (as you've done).

Regards,
Gary

You don't say whether you want a PC or ST application. You'd be better
off going for an ST app since very few PC apps support any of the
proprietry Atari formats.

I've always found ImageCopy to be very good. It's available from the Fast
Club in the UK.

>Or, if it is simpler, a converter from say, D.E.G.A.S. to .JPG format?
>
JPG is in fact a very complex format geared toward 16 or 24-bit images.
Most Degas files are maximum 16-colour and probably wouldn't convert too
well to JPG. You might be better off converting to GIF or PNG.

You can connect a SCSI drive easily, you can not use a Parallel port
version though. You don't need any specific Zip utilities but I think
ICD & HD Driver both allow you to set write protection and passwords.

Hallo together

For you Peter may be itss a new information.

I always had the problem, that i can logon with PPP, get the connection,
the TCP/IP and all is fine.

then i can Ping myself, but not the nameserver. the TX-LED flickers the RX
does nothing.

Now i asked someone on a computer which i pinged, if the packet cames to
him and he says, that nothing is coming!

So the PING-Packet which leaves my modem runs elsewere, but not to the
correct computer.

bye Michael

Yes, it's a well known mod.

For 28k8 DCE you really need 38k4 DTE or higher. The mod gives you
38k4.

There are proprietary boards which do it - RSVE etc.

You can do it yourself with a 4040 chip and a bit of wiring. It has
been described in a number of mags but I suggest you look in
Hallvard's FAQ pages - he has EVERYTHING there.

4086. TOS versus Iomega Zip Drive

Newsgroup: comp.sys.atari.st
Date: 1997-09-27 00:00:00 UTC
From: denr@denr.demon.co.uk
Message-ID: <875365888_OASIS_@denr.demon.co.uk>
Source record: 116212

I am limited to the amount of data I can write to my ZIP disc and I don't know why.

My setup is: Atari 1040STFM with 4meg RAM and TOS v1.4, connected, via Link97, to an Iomega ZIP Drive containing four 25mb partitions, which in turn is connected to a Syquest exflyer Hard Drive containing a 230 mb removable Hard Disk which has 9 partitions of varying sizes.

The setup is "controlled??" by HD Driver v6.13 and I have allowed for 400 folders!

I was copying a great deal of FaST Club Software to the ZIP disk when the system refused to copy any more files to the first ZIP partition (L).

The first system message was "Invalid Copy Operation".

I rebooted and again tried to copy to "L", this time the system message was "ACCESS NOT POSSIBLE TOS terminated the operationt"!

At this stage the ZIP partitions contained the following data:

Partn L Partn M Partn N Partn 0

Folders 256 185 174 260
Items 930 648 791 1,085
Bytes Used 10,329,088 8,537,088 9,257,984 13,187,072
Bytes Available 14,726,144 16,518,144 15,797,248 11,868,160

You will see that TOS allowed me to write more data, without an error message, to Partition O.

I decided to keep writing to Partition O until it was filled or I got an error message!

I got the "Invalid Copy Operation" when Partition O contained the following:

Folders 275
Items 1,134
Bytes Used 13,737,984
Bytes Available 11,317,248

I don't know enough about either ZIP Drives or TOS to sort this problem out.

Any "knowledge", advice etc would be appreciated.

It may be relevant to note that one of my Syquest Hard Disk Partitions has had 283 folders, containing 1,138 files, totalling 22,990,848 bytes written to it with no problems!

Thanks to those who responded to my previous posts,
my MEGAFILE is now sold! ;-)

The following items remain FOR SALE/TRADE:

* 4160 STE (TOS 1.62, 4 Mb) ==>> ie: 1040 STE @ 4 Mb
* MEGA-ST 4 (TOS 1.04, 4 Mb)
* SLM 804 Lazer Printer
* STM 1 Mouse
* Softwares
DTP: Timeworks - Publisher
Soft Logic - Publishing Partner
Music: Dr.T - D-50/D-550 Editor
Dr.T - D-10/D-110 Editor
C-Lab - Notator SL 3.1

Offers from C a n a d a and U n i t e d - S t a t e s ONLY!

Preferably TRADE against following products WANTED (I need those):

* MEGA-STE (TOS 2.06, 4Mb Ram, Internal HD)
* STacy 4 (TOS 1.04, 4Mb Ram, Internal HD).
* Crazydots-2 graphic card for TT (or equivalent ET-4000 card)

NOTE: Canadian banks cause troubles for cashing foreign currency
of any kind, including American. This can be avoided by an
electronic fund transfer (Western Union or similar), which
is usually cleared within 48 hours of transaction.

Nonetheless, if you're interrested in trading your MEGA-STE
or your STacy, we can arrange something, as no money would
be trading hands accross the border.

I believe if you buy a Zip Drive from an Atari Dealer it would be supplied
with some specific Atari utlilities. I have used a ZIP drive on my Falcon
for about 18 months with no problems. I bought it from a PC dealer so no
utilities that I could use. I have HDDriver 4.5 and managed to configure
the Zip set up without difficulty. I use it only as a back up at present
and using Kobold Jobs this is an easy process. My hard drive is filling up
so I'll soon be using the Zip for more than just a back up device

F > Frank
F > who runs N-AES besides MagiC just because of that.

I have a Falcon and Cubase Audio and a fairly simple system (using singletos 4.04, have PowerUp 2 to double the clock speed) but I also use Cab a lot and _was_ considering getting Magic as that seems to be the OS of choice for Cab, especially for Cab 2.5 from what everybody is saying.

I'd like to know what software and hardware are known to conflict with Cubase. You mention that MagiC and cubase are a no go.
How about: NVDI
Geneva
Other systems (I don't know about N-AES)

Hardware: Afterburner040 accelerator
BlowUp F/X Card

What is involved with installing something like MagiC or Geneva? Does the hard drive have to be reformatted? Or is it easier, just load it onto the hard drive and it will work with what is already there?

My idea of "multitasking" is going to the kitchen, or flossing my teeth while a new page downloads into Cab. :^)

And THBBXTHBTTTT! to the snotty one who said that unless you are running cab WITH sting AND mint AND a fast modem it just isn't worth the bother. I ran Cab 1.31 first on a mega4 in mono (graphics on) which I will admit was a tad slow and now I run Cab 2 with stik under singletos on a Falcon and a 14.4 modem which is quite an improvement. The trick is to get the right external programs linked to Cab.

RANT MODE: OFF

:^)

Just what kind of modem do you have? :^) I thought the current limit was 56K (and on the modem forum the majority of people are bitching that they can't get more than 33K or 36K out of their 56K modem) with ISDN modems not being able to work with Ataris. Or do you have some special connection via your University there in Norway? Do you use a special custom modem?

Over a phone line, what is the limit with a Falcon (I only have the Power [slightly] Up 2 accelerator, no Afterburner!) ? Right now I am using a 14.4 modem but would like to upgrade. I just don't want to spend more for power that I can't harness.

Perhaps we can get them to make a version that will run on TT/Falcon and Hades architecture.

Mac-Betriebssystem mit B2-Sicherheit
Das Stollberger Softwarehaus Omega entwickelt ein MacOS-8-kompatibles Betriebssystem, das den Sicherheitsanforderungen der B2-Klassifikation des amerikanischen Verteidigungsministeriums gerecht wird. COS (Crypto Operating System) sollte laut Omega-Gesch�ftsf�hrer Manfred Schmitz urspr�nglich nur das MacOS sicherer machen, was sich aber als so aufwendig erwies, da� man den Spie� umdrehte. Heraus kam ein Client/Server-Betriebssystem, mehrprozessorf�hig, mit echtem pr�emptivem Multitasking, Sicherheitsklassifizierung nach B2, Clustering und einer QuickTime-Eigenentwicklung. Es soll viermal so schnell wie das Original sein, 10 bis 15 MByte auf der Festplatte und 500 KByte im Hauptspeicher belegen und auf 68030- bis PowerMacs laufen. Die Distribution ist nach dem Shareware-Prinzip �ber das Internet geplant (http://www.omega.de), der Preis soll bei 169 Mark liegen; erste �ffentliche Pr�sentation und Vertriebsstart: MacWorld 97 im November. (Hans Wei�) (ix/js)

=20
There are many solutions for converting of graphic formats for ATARI.
Some from items you can to find on most popular ftp-sites.
But... I have interesting program (umich.edu, for ex., has not it in
own 0index) called PISCAN. With it you can get viewing and converting
most of numbers most popular graphic formats which using on the ATARI
including also *.BMP and *.PCX.
For *.* to *.JPG-converting I could be recommended GEMVIEW, very
powerful and versitile tool. It might to work as APP (or regular
PRG-mode) well as ACC-mode.

I can send it to you if desire.

ATTENTION: Don't know, isn't the PICSCAN a commercial product or
not therefore I hope ucsas will notifying me if I'll
can violated unpremeditatedly usenet's policy.
I obtained this product accidentally together with some
floppies from ex-owner of my MSte and don't know nothing
about how the PICSCAN was bought.=20

hi,
I hope someone can help me. I have an Eizo RGB monitor, model 7040-eu.
Is it possible to use this with my mega ste and if so how? How do i
connect it? I don't have the pin out of the monitor.
Please if someone knows, email me. My adress is: mslcts@xs4all.nl

thanks a lot

martijn

Does for me as long as switches 7 (AGM) and 10 (mode 2) are set to on.
With the exception of 180 dpi which is disastrously horrible. 360 is
fine, though.

>In the manual it says it is really BJ130e with dip 10 on and dip 11
>off. To use the printer in cannon mode you really need a BJ130 driver.

My guess is that GDOS and NVDI drivers *are* really BJ130 drivers, as
the printer needs to be in this mode.

>I found the EPSOM LQ mode gives better results anyway.

When I tried it there didn't seem to be much difference (though ISTR
that graphics printed darker, almost too dark), but I suspect that it
varies or becomes more noticeable depending on what you're printing.

There is a trap for the unwary here, though, if you also use other
software which uses its own drivers rather than GDOS/NVDI. Calamus for
example. IME, most Epson LQ drivers insist that the bottom 5cm or so
of the page is unprintable so you end up not being able to use as much
of the page as the Canon is capable of handling. This can be a real
pain if you're printing two A5 pages onto one sheet of A4, for
example. You can adjust the print area margins for the NVDI drivers,
so as long as you only use NVDI to print you can solve this problem.
I never managed to find any way to adjust it in Calamus. If you stick
to BJ10 drivers with DIP switches as above most packages I've tried
work fine.

German development firm developing "Mac OS 8-compatible operating system"

Several readers have written in about a news item (in German) on the German newsticker Heise Verlag, which indicates that when German Developoment firm Omega ran into dead-ends in its efforts to increase security in the Mac OS, it decided to work on the problem "the other way around" -- and began development of its own Mac OS 8-compatible operating system. Here's a translation of the news item:

Stollenberg, Germany, based software development firm Omega is developing a MacOS8-compatible operating system that complies to the Unites States B2 security classification. COS (Crypto Operating System) was intended to make MacOS more secure, President Manfred Schmitz said, but when it turned out to be too complicated, they decided to it "the other way around". The result is a mulltiprocessor client/server operating system with "real" preemptive multitasking, B2 security classification, clustering and a custom QuickTime implementation. It is said that COS is four times faster than the Original MacOS, takes 10 to 15 megs of hard disk space, 500 K of RAM, and runs on 68030- to PowerMacs.

Omega plans to distribute COS as DM 169.- ($100) "shareware". The first public presentation will be given at MacWorld Expo Dusseldorf in November.

How Omega plans to deliver an OS with any kind of interface familiar to Mac users without treading on Apple copyrights and patents isn't known, but the possibilities are fascinating, if they do indeed have an OS that will run Mac OS apps so quickly and in so little RAM. If you have any information on this, or are able to confirm any of the details, let us know!

4103. Re: HELP!! HELP! 520ST

Newsgroup: comp.sys.atari.st

From: bales@hol.fr
Message-ID: <19970927234331375999@ppp102.tou.hol.fr>
Source record: 116229

Jeff Thomas <Yanni@mindspring.com> wrote (�crivait)�:

> OK.. I now have two 520ST and three drives and still can not get them to
> work.

Ok, ok, calm down, don't panic, lets see what's up... Most of what
follows is covered in several FAQs.

> I finally got a manual with on of them today. When I turn my system
> on, it takes about a minute to come up. I dont have any startup disk...

This is absolutely normal. The system is in ROM chips inside the
computer, not on a startup disk. The desktop that comes up is all you
need to get started. It is working perfectly normally.

However, if you boot with a disk in the drive (any valid disk, even
empty), it will come up instantly. You can format a new disk with the
Desktop menu 'File'/'Format disk'.

> The manual states I need to have a disk with Control.acc and Emulator.acc
> files. I dont have this.

The manual states that the machine comes with a disk that contains these
two files. THe machine works perfectly without them. ACC files are desk
accessories. These are small utilities that appear in the 'Desktop' menu
when found on the disk you boot with. Control.acc is the old control
panel that allows you to set several parameters and emulator.acc is a
quite useless VT52 emulator.

You absolutely don't need emulator.acc, and Control.acc can be replaced
by the newer XControl.acc that can be found on Hallvard Tangeraas'
homepage or the umich FTP site.

> The system still comes up woth two floppies on the screen.

This is the GEM Desktop. Normal. Floppy A is for drive A, and Floppy B
is for drive B. If you have only one drive, then it will emulate Floppy
A and Floppy B by asking you to switch disks around.

> I can put a disk in the drive and it says o bytes on disk. I
> know that there are files on the disk because I just took them out of an
> old Start magazine and they had never been opened.

Well, if tha magazine was old, maybe it has suffered bit rot. Old disks
sometimes tend to be erased by the electromagnetic field of the earth
and become corrupted.

Another reason could be a customized disk format. Maybe the disk was
designed as a boot disk with it's own routines. Some games or demos use
this technique as they are copy protected or use a non-standard format
to pack more data on the disk. In this case they cannot be read by the
desktop.

> Where can I get the start up disk or do I need this disk?

Well, er... As I said, you absolutely don't need it.

> I would love to see this thing in
> action but I have taken me six months to find a second machine..thinking
> that me first one was not working...but this one is doing the same thing..

Maybe you should have tried asking around here first ;-) or reading the
Quick FAQ (check out my .sig)

It actually seems to be in great working action. What you are missing is
software to see it running!

> I can goto to desktop and is says GEM and TOS but no version #.
>

If they are the original plain ST's (with no internal floppy drive, ie:
not STF, STFM, or STE), they are probably running TOS 1.0. The copyright
date should be 1985. Quite antiquated machines I'm afraid.

Your first idea should be to make sure you have a double sided disk
drive (720K). The ST disk format is (partially) DOS compatible, so if
you have a 720K drive you should be able to read 720K DOS disks. Most
modern PCs can no longer use the 360K disks that were used on single
sided drives. This will allow you to download programs from the internet
with a PC (or a Mac with PC Exchange). Make sure the disks are formatted
on a PC.

Then, you'll need a memory upgrade, because 512K won't go far nowadays.

A TOS Upgrade will be useful if you will be connecting a hard drive.

I think you are really in urgent need for the Quick FAQ, which was
designed for beginners like you...

AARGH ! I did it :-(

While I was messing with my new HD floppy drive, I seem to have neglected the disk detect jumper (you were right Hallvard!). The result is that I have the FAT of one disk written on the other. I don't think the files themselves have been affected, but the directory no longer reflects the real contents of the floppy.

Of course, thes files were important. :-(

Does anyone know how to get my files back ? Which program could do the job.

Nick

P.S. Nick's Hint Of The Day (tm) : Never test a new floppy drive with important disks :'-(

> for that before trying to connect. NEWSwatch doesn't have the same code.

Thanks Gary, that was the problem all right: changing the POPwatch configuration solved it. But this does seem to point to a bug in the STiK dialer, since I did have CDVALID set to TRUE.

Incidentally, contrary to what it says in the POPwatch docs, if I try to connect with the modem offline, STiK (v1.12) behaves exactly as it should and returns a "Modem is not connected" error message to POPwatch. So I don't actually need the option to check for that in POPwatch anyway.

(Thinks: maybe this is a feature which the stand-alone dialer adds to STiK...)

56K is uncompressed, plain text can be compressed quite a lot so 115200 is necessary with those modems. Even 28800/33600 modems can benefit from higher speeds than 56K if you download a lot of text (e.g. reading news offline).

> with ISDN modems not being able to work with Ataris. Or do you have

ISDN modems works just fine on Ataris.

> some special connection via your University there in Norway? Do you
> use a special custom modem?

Currently I have my Falcon permanently connected to the 'net via a nullmodem-cable. I'm running ppp with MiNTnet.

> Over a phone line, what is the limit with a Falcon (I only have the
> Power [slightly] Up 2 accelerator, no Afterburner!) ? Right now I am

The serial-port on the Falcon can handle 230K, so you can safely buy even ISDN-modems :-) You should ditch the PowerUp though, it doesn't help much compared to Nemesis.

>
> vip

You don't really give us a plethora of details about this...

What exactly doesn't work? Does it give you an error message or just
bomb ? or does it ask for the protection key ?

First you need at least 1Mb, a mono monitor, but most of all, the
dongle. Is your copy a legal copy ? Did it come with the dongle
cartridge ? Did you plug it in correctly (with the ST powered off).

If so, then your problem might be that the cartridge has gone faulty
(sometimes this happens when you plug or unplug it while the ST is on).
Anyway, if this is the case, there's not much you can do, since Steiberg
seems to no longer be supporting the Atari versions... and even less the
old 2.0.

Even older: I've got one from january 97... and it is the second
release, the first one is of November 96.
The French release should be ready in a few weeks, said me the
authors; the other ones (English, Spanish, Dutch & Italian if i remember
well) should be ready at the same time.

A disk has two FATs, one that it uses normally, and a copy of it if
the first is corrupted. Check first if you maybe has the second one
left.

There was an old ST disk monitor, I think it was called Knife ST, in
which you could put sectors from a disk together into a file. Of course,
if the files were fragmented over the disk, it's very difficult to
find the correct sectores together.

Greetings,

Tomas

4114. Syquest 230

Newsgroup: comp.sys.atari.st
Date: 1997-09-28 00:00:00 UTC
From: Walter Hellman <hellman@user2.teleport.com>
Message-ID: <60k8g6sqb1@news1.teleport.com>
Source record: 116145

This is just a report of things going right for a change. My trusty old Supra 52 hard drive gave up the ghost last week. My system had included a Syquest 135 which I used for back up purposes. Fortunately the Supra had started making loud noises so I did a full back-up using the DB3 program which I've had for a few years...just before the Supra failed.

Today I went out and got the Syquest 230 (again a cartridge drive) for $149, including the disk. My set-up now has the Link adapter coming from the STE, to the 135, and then daisy-chained to the 230. It turns out the cable which came with the 135 (which I didn't use because of the Link) was just the right cable to daisy chain...which is good because SCSI cables are expensive).

Anyway, I've never even looked at the "restore" part of the DB3 program, but it just did the job flawlessly as I set up the same partitions on the 230 as I had on the Supra. The ICD Utilities to format and partition the 135 and 230 disks worked great, as well as auto boot feature.

Basically, the Syquest drives work extremely well. They are quiet and do the job. The ST people who made the DB3 program and the ICD hardware and software did a great job and they've got my gratitude.

Walter

Just to set things stright, and I know it is a beta, but V1.13b works
perfect under MiNT for me. I have no problems running multiple STiK clients
and performance <seems> to be a little better. Nick (I think) had
stated that there was some problems under MagiC, but I can't confirm
that as I don't use it.
Just want to give the guys credit, even if they didn't intend it to be
distributed.
Mike

>I'm afraid I've had to give up on Oasis 2.10 (and hence, for the moment
>at least, NewsWatch - sorry, Gary).

I don't blame you. Since the outcoming of Oasis 2 I've tried to use
it. Maybe I was my luck I couldn't make a connection at all.

A time ago I tried to use it offline in conjunction with POPwatch and
NEWSwatch. The e-mail part seems to work more of the less but I didn't
trust it enough to use it permantly. Your mail prove that I've make
the right conclusion. The news part didn't work at all. Oh boy I saw
enough bombs for the rest of my life.
As I don't like Newsie I still use Oasis 1.35 (with POPwatch and
Newswatch)
>
>So I'm back with Newsie. Now all I need is a program to download the
>news headers and allow me to select offline which articles to download
>in full the next time I log on. Any takers?

According to the Newswatch manual with Guy Harrison's Make_Get program
(available from http://www.swampdog.demon.co.uk/ it should be possible
to retrieve news headers when using Oasis 1.35.

BTW: I tought it was possible to retrieve news headers with NEWsie
0.80?

Apparently I was asking to much for my list of ST stuff, so I'm listing for
best offers now. I am able to keep one system (wife has informed me)
so I must sell the rest. If don't have something listed, it doesn't mean
I don't have one. So here I go...

MegaSTe(tos 2.06, 4meg, hd drive (installed as dd until you add ajax)
no internal drive).
1040 STe (one meg)
1040 STe (4 meg)
520 st (1meg, extra power supply)
3- Sc1224 monitor(color, one JVC,)
sm124 monitor(mono w/tilt swivel base)
sc1435 monitor(color, stereo)
130 meg scsi hard drive (external in shoebox case)
30 meg supra (shoe box, drive sticks a couple of times a year)
2- mouse masters
mouse joystick extenders
midi thru out cable
pen mouse
regular mice and keytronics mice
5 1/4 external disk drive and software
ds drive mech
drive and monitor cables
50plus games with boxes and docs(many more without)
Roland D10 keyboard,stand,software for seq +, and three sound cards
access to more equipment and software (TT,copiers,etc....)
Let me know what you want, what YOU want to pay and we can
work out deals.

Thanks....Chris

Not trimming, cause I missed the in-between posts, (but found them on DejaNews).

I speculate that PKZIP crashed in parsing the file names for some sort
of final directory totals or something ... who knows exactly, but
not many programs can handle that many individual files (about 6300).
It may just have been a conflict with QEMM7.5 .. I do have to use
the PKZIP switch to turn off 32 bit DPMI usage as a mater of course.

I mostly wanted the PkZip file as a means to save redundant backups easily
(it takes too long to do anything with 6300 files individually).
I've got it done, and have the files individually on the Zip disk.

Yes, there are many possibilities.

If you just want to DRAW the circuits then any of the CAD programs
will do what you want, try DRAFTPLUS. If you want component placement,
auto routing, pcb masks then try SCOOTER or PCC.

That's right. He is only getting 115k between the computer and the modem, the DTE rate, his DCE rate will be a lot less and will be determined by the modem or the quality of the phone line.

>Over a phone line, what is the limit with a Falcon (I only have the

>spend more for power that I can't harness.

If you were normally using a dedicated connection, such as with a BBS, I would say get a faster modem especially if you do big downloads.

With I-net it's not so straightforward. If you watch you modem during an I-net connection you will find that it spends a fair proportion of its time idle (guess 33-50 percent) because the I-net "timeshares".

Under these circumstances a faster modem would not neccessarily speed up the total transfer although individual packets will be transferred more quickly. Unfortunately there are no tools which I know of which measure line utilisation for TCP/IP protocols so it is very difficult to be objective about all this.

4135. TOSBOX 0.92 emulator available

Newsgroup: comp.sys.atari.st
Date: 1997-09-28 00:00:00 UTC
From: Mark Slagell <bald_soprano@nospam.usa.net>
Message-ID: <342EC8FA.D9C@nospam.usa.net>
Source record: 116166
Cross-posted to: comp.sys.atari.st,comp.emulators.misc

TOSBOX, a system-level Atari ST emulator for MS-DOS and Windows, is now
available in version 0.92.

The program and documentation can be downloaded from:
http://www.geocities.com/SiliconValley/Vista/4448/

Features:
All-assembly language 68000 CPU emulation core
Multiple mounted directories, access to all PC drives
Built-in VGA and SVGA screen modes
Stable I/O emulation, no keyboard glitches
Small executable (zipfile is under 100kb), easy to set up and run
Compatible with Geneva and Neodesk
Works with TOS 1.00, 1.02, 1.04, 1.62, 2.05, 2.06

New since previous version:
TOS 2.x desktop nested-folder bug is fixed
Most terminal emulators now work (no flow control yet though)
Handling of read-only files is improved
DOS-illegal filenames no longer kill processing of archives
XBIOS Getrez() function has been extended for custom color modes

TOSBOX is designed for "serious" applications rather than games and
demos. It is an inexpensive ($15 US) shareware product, but since it
is still in the beta stage, I am more interested in feedback than money
for the moment. The first full release version, 1.00, will have blitter
emulation, RTS/CTS flow control, and some of the remaining bugs
corrected.

R > Great idea! I think COMP/SYS/ATARI/INTERNET is a must. Many
R > Atarians don't know they can access the web!

Oh, and just by forming a new news group called
COMP/SYS/ATARI/INTERNET, miraculously every Atari user that isn't
already on the net will suddenly be connected to the net and this
new news group? Umm, I doesn't quite work like that. Unless a
non-connected Atarian knows a connected Atarian (to the net that is)
we aren't going to see more people here. Besides, there are a lot of
musicians who use Ataris for music only and aren't interested in the
net (like a friend who bought my previous Atari from me). I have
been "on the net" with Cab and Antmail for over a year and a half
but only recently picked up on this Atari newsgroup. Why? Because on
my friend's new bbs, he decided to port a few newsgroups into the
bbs and being a former Atari fanatic he added this one. I still
don't know much about usenet and how to work it because all the
Atari users I know only really talked about Cab. Then they went and
bought PCs. :^O
Hey, I don't mean for this to bring you down, that isn't my
intention. My point is that advertising the internet ON the internet
is not going to bring us more Atari friends. And the ones who
discover us through Internet Explorer, well it's already too late
for them, they've already sold their souls to Bill Gates! >:^)
If you know another Atari user that isn't connected to the net,
volunteer to help them get it all set up. Introducing a person to an
addictive substance is a great way to keep them coming! It works for
the tobacco industry!

?? Akanthos@matrix.kapatel.gr
??
A programm called ??Platon?? exists?; the older versions should run on
a ST with monochrom monitor. It's a german programm?; I don't know if it still
exists. The French importer is APAK, boulevard Voltaire, 75011 Paris if you
went some more details (I don't know the name of the German society which
makes the programm).
I think another one exists, but I can't remember it's name.

Yes I know that but as I don't understand German quite well I prefer
to use the English version. I've ordered the English version some four
(4) months ago now. I'm still waiting. I'm a very patient man but 4
months is a little bit to much.
Oh well for Calamus SL95 dutch version it took six (6) months
before I finally got it (paid in advance).

From what I've heard the French version isn't ready either.

Why are software houses advertising with something they can't deliver?

>work. I finally got a manual with on of them today. When I turn my system
>on, it takes about a minute to come up.

This is because the is no disc in the floppy drive - TOS trolls on
scanning for anything bootable up to drive P:. Very boring. Just stick
a blank disc in the drive and it will finish its boot process quicker.

>I dont have any startup disk...
>The manual states I need to have a disk with Control.acc and Emulator.acc
>files. I dont have this.

Honestly, you don't need it! I suppose you may find Control.acc useful
but its not mandatory.

>The system still comes up woth two floppies on
>the screen.

That's what it should do. Drive B: is "virtual" - it is only referred
to when you copy floppies using the one physical drive.

>I can put a disk in the drive and it says o bytes on disk.

Well, this is a bit more serious. You ought to be able to double-click
on the A: icon to open the disc and use any files on it.

Try this:

Stick in a blank disc.
Use the menu to Format it.
Use the menu to Save Desktop.
Double click on A:

You should see the file DESKTOP.INF in the window - if not there is
trouble with your drive.

Report back .... :-)

I think what the original post meant was that perhaps someone could do for the Falcon/TT/Hades/Etc. what MagicMac has done for Mac/PowerMac -- create a rewritten version of MacOS for 68030/40/60 TOS machines. And if that's not what the original post was proposing, then I will! I'd buy it in a second! I've always wished Dave Small had finished the Falcon version of Spectre GCR, and perhaps this would be a great substitute for that! Just a thought!

Well I did pretty much what you need but I backed up drive C to a folder
on a Zip disk called C and so on. However, I suggest you try what I
said, I thinkt he command to stop it promting you for overwrites etc is
DIALOG_LEVEL = 0
Check the manual to make sure though. If you do what I said and then
add/change the line above it should all run fairly smoothly.

Well, there is the DeskTopper. Thats what I'm using and I bought mine from
Toad Computers. Its rather expensive at $199.00 though. It puts the keyboard
in an external case, and sits down on your ST/Falcons lower half. Has many
many slots, two 5 1/4 bays, internal hard drive bay, cutouts for just about
anything you can imagine, and is very well constructed. I'd never go back to
my old Falcon case...! :)

Hi!

In article <875283552_OASIS_@denr.demon.co.uk>,
denr@denr.demon.co.uk (Denniss Riches (Far, Far Beyond Bedlam)) writes:
> Any "knowledge", advice etc would be appreciated.
>
> It may be relevant to note that one of my Syquest Hard Disk Partitions has had
> 283 folders, containing 1,138 files, totalling 22,990,848 bytes written to it with
> no problems!
Check how many of the items are located in the root directories. FAT
filesystems have a static root directory, thus the amount of items you can
put in it is limited and can only be influenced at partition time. The
usual value here is 256 items, i.e. you can put at most 256 files/folders
into the root directory of a partition.

If you have a large amount of files in your root directories, remove one,
create a new folder, and copy all old and new files into it. Folders are
dynamic, i.e. they don't have a limit on the number of files like the root
directory has.

If this is not your problem, I can't help you, sorry.

Ciao

Thomas

FALCON BASED DIGITAL AUDIO RECORDING SYSTEM

In excellent working condition. Check carefully for the items. They are good and the best on their category! This system works fine and you will be able to produce your music in the digital domain. Whether sequencing or audio editing, it performs fine.

1. Falcon 030 with 16 MB RAM. All required Steinberg audio & timing fixes have been done. Also you can sample with the Line level audio in.
2. 2.5' 60MB IDE Hard disk
3. Wizztronics DEKA interface for using external keyboard
4. Honeywell keyboard
5. Beetle mouse
6. SCREEN BLASTER II (for higher screen resolution)
7. Wizztronic Cart Master LIte (allows plugging in two cartridges at once) (for Cubase and Zero-X)
8. Monitor adapters for VGA and Atari Monitors.
9. Steinberg FDI (DSP PORT Digital interface for digital recording: DAT; CD, etc.!!)
10. External 1GB SCSI (no thermocalibration) Seagate hard disk.

SOFTWARE:
(all are original disks & include manuals)
STEINBERG'S:

1. Cubase Audio V2.06
2. Studio Module
3. Cue Trax
4. Style Trax
5. Data DAt (for backing up files to DAT)

---

6. Zero-X (Superb sample editing program with dongle and registration)
7. BAnd-In-The-Box
8. ExtenDOS PRO 2.4a (CD-ROM driver with direct CD record to hard drive)
9. HD Driver 6.0 (Best Hard Disc manager for Cubase Audio)
10.ICD SCSI PRO Utilities 6.55 (covers things not handled by HD Driver)
11.XBOOT (Wonderful program launcher)
12.Diamond Edge II
13.Diamond Back III
14.Steno
15.Stalker
16.Image copy 4.0
17.CD-ROMS & MORE software.

Price: $ 1350 OBO./ No hard disk $1150 Repply to fpinto@byu.edu for more details. Phil.

4156. FS: Atari 1040 STf plus SC1224: $80+shipping

Newsgroup: comp.sys.atari.st
Date: 1997-09-29 00:00:00 UTC
From: bfrandse@rrnet.com
Message-ID: <60pji5$aou@drn.zippo.com>
Source record: 116041
Cross-posted to: comp.sys.atari.st,rec.games.video.marketplace

I have an Atari 1040 STf computer and SC1224 color monitor available for sale.

The price is $80 plus shipping costs for both items together.

The units have been cleaned inside and out (no dust bunnies or caked on
dirt+grease on the keyboard).

The CPU turns on, and since I don't have any system disks to test it with,
it will boot into the rom bios within 30 seconds or so.

Connecting a generic joystick to the mouse port and repeatedly pressing in
each of the four directions moves the mouse as expected.

So, everything seems to work as it should---HOWEVER, since I don't have any
disks to test the floppy drive out with, I cannot guarentee that it works,
but the rest of the system is tested and works fine.

The monitor has been cleaned on the outside, and spot cleaned (removal of
dust/etc..) on the inside. The tube is in excellent condition, and when tested
with above computer looks very good.

Included is ONLY the bare keyboard/cpu console, special video cord and
color monitor, plus instruction manual for the CPU.

NO additional cords (generic a/c line cords, etc..) are included. You can
pick up these generic cords for around $5 each at many stores.

- Shipping via USPS priority/parcel mail or UPS ground to lower
48 U.S. states ONLY. (sorry, I cannot ship out of country)
Buyer pays all shipping costs.
- My zip code is 58103 if you want to estimate what your cost will be.
- Prepayment required in form of money order.
- Multiple references available upon request. I've been selling
extra videogame carts in rec.games.video.classic for over 2 years.

Or check here for some right references online:
http://206.79.255.84/aw-cgi/UserISAPI.dll?ViewFeedback?userid=bfrandse@rrnet.com

Thank you for your interest.

I think this can easily be explained: Note that even small files use at
least a so called cluster, i.e. 2 sectors in most cases. The larger a
partition, the larger the cluster size. So a file only a few bytes in
size might well need several KByte of your disk space. This is normal
and results from the structure of the FAT file system used under TOS and
DOS. Even a few small files can fill your partitions easily.

Connection a ZIP or JAZ is no problem at all. If you want to make use of
the unique read/write protection featurs of these drives you should have
a look at HDDRIVER
(http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html). HDDRIVER
comes with special support for ZIP and JAZ drives.

Um, excuse me? I work for Gateway 2k and we have 0 plans to manufacture ANY Amiga computer systems or devices for the commodore amiga. It is a dead issue. The company bought the technology & papers for the chipsets in the misguided attempt to develope some of the technology into our product such as accelerated video boards and such. But the technology proved way too old for the emerging computer scene what with the AGP technologies and Pentium 2 chips, the amiga designed video chipset was way too slow to keep up. Theres still chance of other uses but its been put on backburner for now. BTW, the location you mentioned that they are building is a new HUGE manufacturing plant in Salt Lake City , Utah to keep up with demand for their PC product. They are hiring 1700 new employees for this plant, not 1 for making amiga computers!

This is not meant to be official info from GW2K , just my scoop from our meetings.

Hey, wait a minute, what I was complaining about is not freely
distributing commercial software (although I do not approve), but
wasting bandwidth and being a nuisance by posting a 300K binary to two
newsgroups. A complaint has been filed with his postmaster and he has
made excuses (well, at least to me), so I guess the issue is closed.

>I have. It copies raw data..

Is it hardware or software based?A bog-standard PC won't copy the
majority of extra-formatted ST disks. Fact. It simply can't read them.

Using programs like VGA Copy you can squeeze those trouble-some disks
a bit and read some of the extended format disks created on the ST on
your PC. It works a lot better than using native DOS (obviously) but
is still far from perfect and there are still various disk formats it
can't handle (the higher you get, the less results). Your copier may
copy "raw data" but how does it copy raw data it can't actually read?
Unless it's hardware based of course.

>>> >Well, I can't copy it, and I believe I have more knowledge about Atari-computers than

>>
>>> Im not a an average game player my friend.
>>
>>No but what about those who are? Can they back up originals?
>
>No, but that wasnt the issue here. You said it was impossible to copy an
>original game if you didnt crack it. It isnt.

If it was impossible to copy a protected game at all, then software
houses would be buggered as even their distribution plants would be
unable to duplicate those disks. But they use dedicated hardware,
special machines reaming off X hundred disks an hour. Not a little ST
plugged into a TV in some bedroom. By your statements you've proved
that it is indeed impossible to copy an original game without the need
for external assistance, be it in the form of a completely different
computer or additional hardware.

Why do you insist on using the BJ10 in BJ mode? Dip-switch it to LQ
emulation, and all problems will be solved. The LQ mode emulation is
one of the advantages with the Cannon BJ series printers.
All atari progs with a print option has an LQ driver.

Dont forget that the minimum unit of disk space is a cluster, so a 1byte file
will still take one cluster, this could be 512 bytes in size up to 64Kbytes
in size depending on your patritioning scheme.

I just happen to know of a handfull of people who are now emplyed by gw2k, that
is Amiga Inc., to continue develop the OS and also look into future hardware.
Most likely future amiga, if any, will use standard components, like PCI (and
sucessors) peripheris (gfx, ethernet etc). Amiga is far more than video capa-
bilities, the strongest point is still the OS.

>This is not meant to be official info from GW2K , just my scoop from our
>meetings.

Just wondering.. you happen to know Jeff Schindler, Joe Burke, Joe Torre
or Derreck Lisle? No? Funny, their emoyed by GW2k to work with amigas :)
In addition there is the german crew at Amiga Int.

Oh.. eh.. the amiga will never really die :)
(it's just resting, you see, pining for commodore..)

>
> Thanks

The dip switches should be for the drive ID, so as long as then thing is
set to be drive 0 it should work. I'm not a specialist though.

However you might be interested to learn that the SH205 can be used for
SCSI drives, allowing you to use something a bit more reliable and with
higher capcity than your old 20meg mechanism.

SH205 are made of a DMA/ACSI to SCSI host adapter, to which is atached
an Adaptec SCSI to RLL adapter, to which the drive is connected. If you
bypass the Adaptec, you could connect directly a SCSI drive. At least
that's what I've learned from reading usenet messages about the SH205's.

NVDI not only works, I consider it a must have for Cubase Audio Falcon. I also have a Screenblaster which, although some say it doesn't work well (the people at Sunrise Audio), worked perfectly for me.

> > Hardware: Afterburner040 accelerator
> > BlowUp F/X Card

> the AB040 though and I guess Steinberg wont fix it either.

Has anyone come up with a fix for the display bug? Evidently, if you are in the audio wave editor zoomed in, and play back the audio, when the playback scrolls to the next screen of audio, the audio drops out. Is this accurate?

FYI, I have had verification that the Nemesis card works well with CAF.. I'll be buying one soon.

It won't work with graphics printing via GDOS, I believe, as the filter only translates the character code sent to the printer, in the same way as for First Word Plus drivers.

h> "Idealist" which lets you do all sorts of fancy stuff when printing
h> has the possibility to add filters/remapping (I checked a few of
h> the drivers there, and tried to figure out how by checking the
h> "readme" file). Unfortunately the BJ-10 driver doesn't have it, at
h> least not for these characters. I can't quite figure out how it's
h> set up either. Can anyone help me with this?

Yes, I think I can - as long as you have the Canon BJ-10ex's printer manual and the printer in fact has a Norwegian character set in its software. While the IdeaList Canon BJ10e driver does not offer many character translations, take a look at the end of the driver for the BJ300 and use that as a prototype. Most of the entries are in decimal, a few include characters (in single quotes).

The value starting with 'p' is the ASCII value of the character to be altered (you can establish this for the screen font in use with the CHAR_TAB.CPX, for instance). You then send the escape code group to select the Norwegian character set (on my HP DeskJet 520 this would be 27 40 48 68 for Norwegian1 (ISO 60) or 49 in place of 48 for Norwegian2 (ISO 61) but this will be different on the Canon - this quite likely is the 27 91 84 4 0 0 0 3 xx used in the sample, where xx determines the character-set) followed by the ASCII value of the converted Norwegian character (on the DeskJet this is 91 for AE diphthong, 92 for crossed-O, 93 for A-ring, 123 for ae diphthong, 124 for crossed-o, 125 for a-ring) and then another escape group to return to the normal language set.

If you only have the hex values in your manual you can use these but each must be preceded by the '$' dollar sign.

Hope that helps

Regards
Peter

Well, good thing you work for Gateway 2000 and not for Amiga Inc. Because luckily, Amiga Inc. (a wholly-owned subsidiary of Gateway 2000 which is apparently clever enough not to employ you) has lots of plans for the Amiga. And I'm glad you think so much of your management that they'd mistakenly spend millions of dollars and months of research on something which they then discovered was only fit to be put on a shelf.

: >Theres still chance of other uses but its been put on backburner for now.

I'd like to give this a try, but I don't know where to get Oasis 1.35 from. Someone did send me a copy, but the archive was corrupted. Can anyone point me at a URL or FTP site?

> BTW: I tought it was possible to retrieve news headers with NEWsie
> 0.80?

As in previous versions, the headers are downloaded and displayed, and it's possible to read selected articles on-line - but it isn't possible to select headers off-line and then logon and automatically download just the selected articles.

Source record: 116125

On Sep 28, J.Kock (kock@kockens.pp.se) suggested Diamond Edge to help unscramble the directory on a partition of my harddrive.

I checked the DIR with MONOME.PRG and saw the scrambled version of the directory.
However on looking at FAT1 or FAT2, I see the directory contents as they should appear in the directory. Somehow both allocation tables got replaced with directory contents.

Q: Is this partition totally screwed beyond the help of Diamond Edge or other rescue applications etc?
Q: Should I (gulp) just reformat?

Regards
Jan

Cubase works on both the Afterburner040 and FX-Card. You can't use
Fast-RAM on
the AB040 though and I guess Steinberg wont fix it either.

> What is involved with installing something like MagiC or Geneva?

With MagiC you just run the install program.

> Does the hard drive have to be reformatted? Or is it easier, just
> load it onto the hard drive and it will work with what is already
> there?

You wont need to do anything. It will just work as it is. You might have
to remove a program or two from the autofolder if they doesn't behave
properly.

I have just uploaded some new stuff on my webpage:

- TT030 Homepage
More details on the M-STE/TT Modem-2 upgrade.

- Download Bay
Updated info on the future of Atari copyrights,
possible TOS purchasers and more.

I'm still taking URL submissions of M-STE and TT pages,
mainly those with usefull hacks or patches and also for
homepages of TT hardware/software developpers.

Also, check out Thomas Much's Homepage.

http://www.uni-karlsruhe.de/~Thomas.Much

Thomas and Gotz Hoffart are begining work on The TOS Book.
This freeware HyperGuide and HTML document will eventually
document ever TOS enhancement (NVDI, WDIALOG, MiNT, etc.)
to become the definite replacement for reference materials
such as The Atari Compendium and the Atari Profibuch. Best
of all, IN PLAIN ENGLISH! ;-)

Should people with expertise in MiNT, MiNTnet, STiK, STinG,
OLGA, WDIALOG, NVDI or just plain Resource styling contribute
to this ongoing project, it might ensure the future of Atari.

From: Martin-Eric Racine FUNKYWARE http://www.megacom.net/~q-funk

Jan, not sure if this will help or not, but ST-Tools is very good at
recovering lost (deleted) files. Maybe you could give it a shot? Its
shareware, and not crippled AFAIK. Its saved my proverbial bacon on
more than one occasion! :)

You need to buy the RSVE upgrade kit, which includes HSModem v7. I bought
mine from Toad Computers for $59.00. I'm sure other places like Computer
Direct has it too! Its pretty easy to install yourself-but if you can't
solder at all, then have your closest dealer do it for ya! Have fun! :)

4209. FS: Atari SM124 Monitor

Newsgroup: comp.sys.atari.st
Date: 1997-09-29 00:00:00 UTC
From: Kevin Manne <KevinManne@wycol.com>
Message-ID: <342FE4C9.623@wycol.com>
Source record: 116182

Greetings:

Yesterday I bought an Atari SM124 Monitor, foolisly thinking that it was a SC1224 Color monitor. I have no use for this monitor, so if anyone wants it, $10 plus shipping takes it (that's what I paid for it). The monitor powers up OK, but I have no way to test out the picture on it. There's a hint of burn-in, but it's not too bad. E-mail if you are interested.

Thank you,
-Kevin

>Is anyone surfing with a Falcon at 28.8? 33? 56? Please let me know
>your experiences and what the fastest modem I should get for my
>setup.

I am currently using a Falcon with NVDI / Magic 4 and an "Enact" ?
33,000 modem. My previous modem was a 14,400 supra (LC) I noticed an
immediate increase in speed, and of course reliability since the
supra was pretty old technology (in reletive terms), Everything, of
course, depends on the connection and how far things have to come, how
busy the site's are but on a local connection to my server's web site
I downloaded a 1.4Mb file in about 5mins which would have taken around
20 mins with the supra. I don't know if thats good or bad or even if
I have the Falcon set up to take full advantage of the modem! I use
HSmodem7 and have the port speed set to 57,600 in the StiK dial scr.
this seems to work but perhaps it could be set higher. The Falcon is
still new to me and I'm quite sure I could push it harder :-) So the
answer is that yes a 33,000 Baud modem would be an advantage and
mostly usable dependant on line quality (I guess)

Does the brand of modem make a difference with Cab?

Don't think so!

>
>Is there any way to test the throughput of the modem with Cab other
>than to watch how fast the bytes come down the line?

I would be interested in an answer to this one also :-)

>I have read in a PeeCee modem forum of
>many users of 56K modems trying to connect with 56K servers and
>maxing out at 33K!

Certainly I've heard this as well. I don't know where you are but in
the UK the telephone Co. (BT) are reputed to only support a max of
33,000 at the moment, I don't know how true that is but certainly
where I live the local exchange is pretty ancient and so I tend to
believe this would be true for me. Don't even have caller ID yet!!

>
>Dave

Hi Sounds Like MagiC did not install all the files correctly and an
old file like the res for magic desk did not install over the old one. Did you
do a reboot before you started using it.

That will cause the problem as described.

The main files that have changed are the magic ram and the magic desk
and rec file..

Drop back to tos copy all the Magic Files to another folder delete
them and do a clean install problem solved. Keep the applicant.dat and
info files as these hold all the set up info install and copy these
back do a reboot and all should be fine.

MagiC 5.11 is a lot better than all previous versions real smooth and
faster a crash is real rare. Programs seem more compatable etc...

From: Tom <tommy@nospamniagara.com>
Message-ID: <343169E3.71E6@nospamniagara.com>
Source record: 115941

I'd just like to throw something into the newsgroup for clarification. Isn't Atari [tm] a trademark, and aren't all of you using the name Atari [tm] without acknowleding it as a trademark actually pirating that wonderful name Atari [tm]. I'd hate to think some of the dogooders who have flamed, insulted and bashed poor users who want to use a disk based TOS [tm] with their emulator are actually the worst kind of pirate themselves. You word thieves you!

Seriously, Atari is a trademark and it should be acknowledged as such. We should start reporting to people's providers whenever the name is used without acknowledgement of the trademark. Stealing Atari [tm]s name, without acknowledging the trademark, is thievery dammit, and just as bad as those terrible people pirating pac man and space invaders.

From the manual of my trusty SH204:

Atari is a registered trademark, and SH, ST, and TOS are trademarks of Atari Corp.

> anything you can imagine, and is very well constructed. I'd never go back to
> my old Falcon case...! :)

...and it's extremely ugly ;-) I'm using a PC Maxitower that I converted.
The conversion consisted mainly of mounting the PSU vertically instead of
horisontally to make room for the gigantic Falcon PCB. I also had to
remove two of the six 5.25" bays.

Then I just glued the bottom-half of the original shielding to the plate
where the PC motherboard usually sits, and mount the Falcon PCB in the
shielding as usual. That's about it, there were cutouts for a lot of
D-connectors (VGA, mouse/joystick, serial, modem etc.) on the tower so I
only made some simple extenders for the ports I needed.

>You can't use
>Fast-RAM on
>the AB040 though and I guess Steinberg wont fix it eithe

The reason is that FastRam is not part of the Falcon's audio matrix. SoundPool WaveMaster and the new version of ZeroX (2.0) use Fastram for a buffer but still the audio must be moved to ST ram in order to play correctly.

>Does someone say that Cubase Audio (or just plain old Cubase) works
>under
>N.AES??? I thought it was as bad under N.AES as under MagiC.

Why even try? It will load and run under Geneva but it really taxes the psystem

I used to experience this, it all depended on how far you zoomed in. Its a conflict with NVDI apparently. Make a copy of NVDI and set its flags to only load into STram.

Hi - Just wanted to let everyone know there's a new Atari site available.

Please stop by and visit my general information site for Atari computers.

It's a new site, and still being built, called the "Atari Reference Desk."
Being new, it doesn't have a lot of information yet, but here are some
of the things I'm working on:

Links: (Naturally) - General purpose links to other Atari sites on
the web.
What ever happened to...: A place for people to find out what is
happening with figures who have loomed large in the history
of Atari.
HELP: A quick reference section of answers (and links to appropriate
pages, to avoid duplication of effort) to common questions
posed in the Newsgroups.
Program Reference Library: A summary of Atari programs available
for download, and current registration details - There is also
a form for programmers, to provide details about their
programs.

And more to come.
I've made a conscious effort to make these pages friendly to people
with minimal systems (slow processors, slow modems, medium resolution).

I'd appreciate it if you stopped by and gave me some comments on
the concept and implementation.

Thanks,
Terry

R > Great idea! I think COMP/SYS/ATARI/INTERNET is a must. Many
R > Atarians don't know they can access the web!

Oh, and just by forming a new news group called
COMP/SYS/ATARI/INTERNET, miraculously every Atari user that isn't
already on the net will suddenly be connected to the net and this
new news group? Umm, I doesn't quite work like that. Unless a
non-connected Atarian knows a connected Atarian (to the net that is)
we aren't going to see more people here. Besides, there are a lot of
musicians who use Ataris for music only and aren't interested in the
net (like a friend who bought my previous Atari from me). I have
been "on the net" with Cab and Antmail for over a year and a half
but only recently picked up on this Atari newsgroup. Why? Because on
my friend's new bbs, he decided to port a few newsgroups into the
bbs and being a former Atari fanatic he added this one. I still
don't know much about usenet and how to work it because all the
Atari users I know only really talked about Cab. Then they went and
bought PCs. :^O
Hey, I don't mean for this to bring you down, that isn't my
intention. My point is that advertising the internet ON the internet
is not going to bring us more Atari friends. And the ones who
discover us through Internet Explorer, well it's already too late
for them, they've already sold their souls to Bill Gates! >:^)
If you know another Atari user that isn't connected to the net,
volunteer to help them get it all set up. Introducing a person to an
addictive substance is a great way to keep them coming! It works for
the tobacco industry!

Currently I am using a 14.4 modem with my Falcon/Cab/Stik setup. Is anyone surfing with a Falcon at 28.8? 33? 56? Please let me know your experiences and what the fastest modem I should get for my setup. Does the brand of modem make a difference with Cab?

Is there any way to test the throughput of the modem with Cab other than to watch how fast the bytes come down the line? (holy inaccurate methods batman!) I have read in a PeeCee modem forum of many users of 56K modems trying to connect with 56K servers and maxing out at 33K!

Thanks in advance for any info.

U > --

Yes, but...
I have noticed this "feature" when copying files to different sized
partitions. Files can swell AND contract in quite an amazing manner.
But on my system, the file size is reported accurately so if a 40K
file becomes 49K on a larger partition, I know it. It doesn't get
reported as 40K when infact it is taking up 49K.
I'm using tos 4.04, there could be the chance that earlier tosses
ARE reporting the file's original size, not the new and improved
size. A possibility perhaps?

Just what kind of modem do you have? :^) I thought the current limit was 56K (and on the modem forum the majority of people are bitching that they can't get more than 33K or 36K out of their 56K modem) with ISDN modems not being able to work with Ataris. Or do you have some special connection via your University there in Norway? Do you use a special custom modem?

Over a phone line, what is the limit with a Falcon (I only have the Power [slightly] Up 2 accelerator, no Afterburner!) ? Right now I am using a 14.4 modem but would like to upgrade. I just don't want to spend more for power that I can't harness.

F > that's true: the main problem is it does'nt run at all;-<
F > Frank
F > who runs N-AES besides MagiC just because of that.

I have a Falcon and Cubase Audio and a fairly simple system (using singletos 4.04, have PowerUp 2 to double the clock speed) but I also use Cab a lot and _was_ considering getting Magic as that seems to be the OS of choice for Cab, especially for Cab 2.5 from what everybody is saying.

I'd like to know what software and hardware are known to conflict with Cubase. You mention that MagiC and cubase are a no go.
How about: NVDI
Geneva
Other systems (I don't know about N-AES)

Hardware: Afterburner040 accelerator
BlowUp F/X Card

What is involved with installing something like MagiC or Geneva? Does the hard drive have to be reformatted? Or is it easier, just load it onto the hard drive and it will work with what is already there?

My idea of "multitasking" is going to the kitchen, or flossing my teeth while a new page downloads into Cab. :^)

And THBBXTHBTTTT! to the snotty one who said that unless you are running cab WITH sting AND mint AND a fast modem it just isn't worth the bother. I ran Cab 1.31 first on a mega4 in mono (graphics on) which I will admit was a tad slow and now I run Cab 2 with stik under singletos on a Falcon and a 14.4 modem which is quite an improvement. The trick is to get the right external programs linked to Cab.

RANT MODE: OFF

:^)

Hi Jo,

At the risk of upsetting people of inappropriate use of the newsgroup:

No one knows for certain. Some scholars think is comes from the US' 7th President, Andrew Jackson, who wasn't well-educated and had a habit of misspelling "all correct" as "orl kurrect." When he was too lazy to write it out, he simply wrote "OK," or so the story goes. There are, however, no written examples to support this claim.

Others say it comes from the Jamaican "oh ki" for all right, while US President Woodrow Wilson said it came from the Choctaw (an American indian tribe) word "okeh."

Most linguist seem to think it originated with the presidential election of 1840 - Democratic nominee Martin Van Buren was born in Old Kinderhook, NY and one of the groups that supported him was the Democratic O.K. Club. Other Van Buren booster began using the letters O.K. to signify their support of the candidate, and when he was elected, everyone was assured that the country would be OK.

Well Jo,

To illuminate it for you: O.K., also, known in some regions as 'alrighty dity' / 'you betcha' / or 'yes siree bob' and is actually the colloquial adaptation of the phrase 'oki doki' (which is however not to be confused with 'hokey pokey' or Okie from Moskogee').

If your partitions are not too big (< 32MB), you can also connect your harddrive to a Windows :-(pc with a SCSI card, are maybe a Mac.
But you can also connect your harddrive to a TT or ST with an ICD-host adaptor.

Als je partities niet te groot zijn (< 32MB), kan je je harde schijf ook aansluiten aan een Windows :-(pc met een SCSI-kaart, of misschien ook aan een Mac.
Maar je kan je harde schijf even goed aansluiten aan een TT of een ST met een ICD-host adapter. Ik denk dat in Nederland toch zeker nog mensen te vinden zijn met een TT of ST.

I know, its not an Atari system, but it came from an old Atari house and
needs a good home. New price, $900 takes all!!!

Following system for sale. In excellent condition with lots of
updated equipment I added to original system configuration. All
hardware is working and configured in the system. Good all around
clean system.
Here are the specifications:

TOAD Computers Chameleon System-Severna Park, Maryland-place of origin

CPU-Intel Pentium 133 Mhz-socket 7 with heatsink and fan
32 MG. Ram
256K cache
1.2 GB Hard Drive
Matrox Mystique 2D-3D Video Card with 4 Mg. Ram(nice 3D Card)

SoundBlaster AWE 32 soundcard upgraded to AWE 64 via Creative Software-
-WaveSynth/WG- CD included(upgrades AWE32 to AWE64 compatible)-
-comes with 8 MG memory on board - 4 MG SIMMS X 2(30 pin)
Sound good? ;^)

ZOOM K56FLEX Fax Modem-Internal-Model 2819 PnP
rated in the top by CNET

8X Speed Creative CD drive

Eagle 96 Exabyte Tape Backup System(internal) with excellerator
board(installed)
and 4 backup tapes 1.6 GB uncompressed 3.2 GB compressed per tape-
-(4 Tapes Included-Verbatim MC3020 EXTRA)

1.44 Floppy drive

Spacewalker HOT-541 Motherboard-includes VRM Module so you can put an
MMX CPU in it. Upgrade to MMX in the future.
(Motherboard Spec's:Intel PCISET, Memory-up to 128MB, 246KB cache-up
to 512K, 32-bit PCI bus slot x 4, 16-bit ISA bus slot x4, 2-channel
PCI IDE port, supports up to 4 IDE devices, one floppy port, one
parallel port-SPP/EPP/ECP, 2 serial ports-(more info at
www.shuttlegroup.com)

VRM-HOT 106 voltage regulating module 553/MMX Power Regulator-installs
in motherboard next to CPU-plugs-in. (module not installed in
motherboard yet since Pentium 133 CPU does not require it.

Windows 95 Keyboard

Joystick

Microphone (external)

Speakers-under monitor-3 speaker-A-B mixing-"headphone jack"-RCA phone jack inputs-Tandy model MMS-10

Beetle Mouse-serial 3 button mouse

Windows 95-installed * Encarta 96* MicroSoft Works* Microsoft Money-CD's included.

Tower case-16.75" long 13.5" high 6.75" wide

Nice all around system---ASKING US$900 + Shipping. US & Canada ONLY!!

System shipped insured via UPS if possible
System is in A-1 condition. Been selling stuff on-line for a couple of years now.- references supplied upon request.

>If anyone has any info and/or prices regarding various replaement cases
>for Falcons (Eg. the Mk-x) I'd be very intrested to hear them.

I have my Falcon in a Lighthouse tower case from System Solutions with
Freekeys (or what ever the thing is called where you re-case the Falcon
keyboard).
The case is large and heavy. It is constructed out of a large hinged
metal frame, which makes working on it easier, with thin metal covers
for the two halves. It was quite easy to fit the Falcon in to the
tower. Though it was my first attempt at such a thing so was a
little nerve racking.
It cost about 180ukp a couple of years ago.

I seem to remember writing an article about fitting my Falcon into
the tower case but I can't find it. I may have posted to the Falcon
Fact File I will have to have a look.

I hear good things about the Mk-X cases, check Titan Designs' website
for details, http://ourworld.compuserve.com/homepages/TITANWEB/

Are there very manypeople in New Zealand that still have modems and
still have there atari st's as i am the sysop of the Star Two Bbs and
have not been running my bbs as nobody was ringing it and i have
purchased the latest version of express.
If there are people in new zealand who would ring it again if i put it
back up then either reply to this email by sending it to
cgbohm@ihug.co.nz or by ringing me by voice.

I think the idea was to make this other MacOS compatible OS run on
Atari hardware to let us use all Mac software out there.

About MacOS8 and MagiCMac, there is an update available to make it
run under MacOS 8.

I'm pretty sure you have the last version. It was discontinued by
WordPerfect Corp. years ago amid a storm of controversy. The Atari 4.1
version is really pretty good even compared to later PC versions.

Source record: 116070

Hi all. I just got MagiC 5.11 and already I'm getting tons of error
messages, repeated memory dumps to the hard drive (12megs at a time),
but I think the worst problem is that it won't shutdown. It gives an error
message, and brings up the fileselector asking for a program to run.
If I hit [cancel] it just runs the MAGXDESK.APP again.

Should I just reinstall MagiC, after rooting out all MagiC files from the
hard drive? I don't see the answers I need in the manual.

Technical help needed.

Is it possible to run an Epsom Sylus 600 printer from an Atari?
The thing is windows plug and play complete with CD-ROM but are there any
Atari drivers for it?

We use That's Write Three, Timeworks Publisher and now we have Calamus.
We have an Atari STE with 4 Megabytes of RAM and an almost empty 720Mbyte
hard disk.

Email any advice to

kadu.flyer@zetnet.co.uk or

> for Falcons (Eg. the Mk-x) I'd be very intrested to hear them.

A while ago, I had mine in a DeskTopper, but it was ugly and too small
for
the HDs/CD, so recently I built one :-)

Bought a small cheap pine 'bookshelf' kit (4 corner posts, 4 shelves),
some pine cladding (the thin planks of wood with a groove at one edge
and a
tongue on the opposite edge), and made a cupboard (with doors on the
front)
to hold the Falcon, and a couple of bookshelves on top... It worked out
great!

Bought some wire and connectors from Maplin, and drew out the
serial/audio
etc ports to the back of the case.

Oh, had to buy a larger power supply to run the Falcon, 3 HD's and a
CDROM
drive at the same time. It also gave me an excuse to buy some newer
tools
:-)

Total cost, around 55 pounds, and 3 days work.

ATB,
Simon.

Hello everybody,

I've put on my home page the October release of Eureka 2.12.
It's a 2D Graph Describer and a 3D Modeller. It's freeware
and will run on all Atari platforms and most emulators.
It has now, thanks to Karl SAMYN, an English documentation.
All the program is in two languages : French and English.
You may tell me more about the English translation, and
mistakes I would have made. I'm expecting a feedback for
it. Thanks to all ... Bye for now,

>setup. Does the brand of modem make a difference with Cab?

I'm using a USRobotics Sportster at 28800 with my ISP and it works fine. It
really depends on how fast your ISP goes, as far as getting 56k modems. Also
be aware that there are 2 standards right now. Many 56k users are not getting
56k because of their ISP, poor phone lines, etc, etc,.. (also be aware that
under ideal conditions you would only get 53k because of line voltage-the
phone company won't let you go faster) Check with your ISP to see how fast
they allow, and what standard they support before getting a 56k modem. :)

I don't know. Have you tried the patch program Doug made for CAF on the
AB040?
It might fix it but I'm not sure. Apparently most problems on a 040 are
down
to dirty programming by Steinberg and could easaly be fixed by someone
with
access to the sourcecode. ;-)

You will get a lot of replies, Jo!

The one I remember is that it is the contraction of "Orl Korrect" -
which is a mis-spelling of "All Correct".

So, perhaps we should be saying A.C rather than O.K :-)

> 0.80?

Yes, you can retrieve the headers. The only problem here is that once you've got them, you can only mark those you don't want, ie. so NEWSie thinks that they've already been read. If you want to get one article and it's numerically in the middle of some that you don't want, NEWSie starts getting from the one you want and carries on from that one, including the ones you don't want.

A new feature would be the ability to read the headers from each selected group and create a 'get me' list, as oasis2 does.

4268. Back up programs!!!

Newsgroup: comp.sys.atari.st
Date: 1997-09-30 00:00:00 UTC
From: bertilow@aristotle.algonet.se
Message-ID: <60reho$3lt$1@zingo.tninet.se>
Source record: 116083

Please!!! Help me find a decent program that can back up my hard disk to floppies, and restore it, without falling on its face.

I've tried heaps of different programs, and they are all so incredibly bad. Surely someone must have come up with something that works, but where is it?

I have used Diamond Back II, but I had to sack it when it failed to restore its own back up files for the umpteenth time. I just tried out the Vault which seemed great, until the restore program Key tried to do a test restore - plain anarchy! Are people actually using this crap?

Please, what are you guys using?

I actually paid good money for Diamond Back once. Since its so bad it's close to a fraud, I won't buy anything again until I can try it out for free.

>
>Gruss und TIA, Harold

Sorry, I just realized, I posted a german message to an international newsgroup. Here comes the english equivalent:

While I was doing a late spring cleanup I stumbled over my old Videodigitizer for the Atari ST. It is from Merlin Computer GmbH, a german hardware manufacturer, but was also sold by other international vendors. The name of the module was EASYTIZER.

Unfortunately I can't find the disk with the accompaning programs to read out the data from the digitizer. According to the manual the names of the files are EASY_SW.PRG, EASY_COL.PRG und EASYTIZE.RSC.

I realize, that this baby is rather old (8 years or so), but if by chance anybody has these programs, I would be very glad, if you sent them to me.

Many thanks in advance, Harold
